- 2C Geotechnical Supplemental Report Memo
- 2D Meeting Agendas and Notes

### 1 - EXECUTIVE SUMMARY REPORT

#### **SCOPE OVERVIEW**

TCF Architecture and its consulting team completed the full scope outlined in the original Phase 1 - Predesign proposal, with additional fee remaining. The Predesign work exposed several high risk or high uncertainty items including storm water management system design, retaining wall system design, possible increased wetland setbacks, and soil contamination remediation. See the Draft Predesign report for additional information. TCF and the City of Shoreline agreed to use the remaining Predesign fee to continue exploring high risk items and to further develop the architectural design of the buildings to provide a more detailed preliminary Schematic Design project estimate for use in establishing the Maximum Allowable Construction Cost (MACC) budget for the Project.

#### **APPROACH**

#### **ARCHITECTURAL (TCF ARCHITECTURE)**

<u>Building Development:</u> Expanding on work initiated in the Predesign Phase, the architecture of each building was further developed. Building massing, heights, and materials and finishes are suggested in the Predesign architectural narrative and conceptual renderings. The final design concept and materiality have not yet been thoroughly reviewed or approved by the City and will be used as the basis for estimating and budget-setting.

<u>Cost Estimate Information</u>: The building information was provided to the project's cost estimator in order to determine a more detailed estimate for architectural elements.

Concept C – Rendering and design used for budgeting purposes

#### STRUCTURAL ENGINEERING (AHBL)

<u>Building Development:</u> Expanding on work initiated in the Predesign Phase, structural framing and foundation plans for each building were developed. Updated soils information provided by the Geotechnical Engineer informed over excavation (see civil) and foundation sizing requirements.

<u>Retaining Wall Development:</u> As discovered in the initial Predesign phase, the site requires retaining walls along several edges of the site ranging from 3' - 20'+ in order to best utilize the site available and fit the recommended program. AHBL provided retaining wall preliminary designs, including concrete cantilever wall up to 4' above grade, a concrete cantilevered wall with increased footings from 4'-8' above grade, and a soldier pile wall for walls over 8' above grade. All retaining wall options are without tie back anchors, adding these will potentially reduce cost, but it will require coordination with WSDOT and the use of the right-of-way along Ballinger Way (SR 104).

<u>Cost Estimate Information:</u> Building structural layouts and retaining wall information were provided to the project's cost estimator in order to determine a more detailed estimate of structural elements.

#### MECHANICAL & ELECTRICAL ENGINEERING (BCE ENGINEERS)

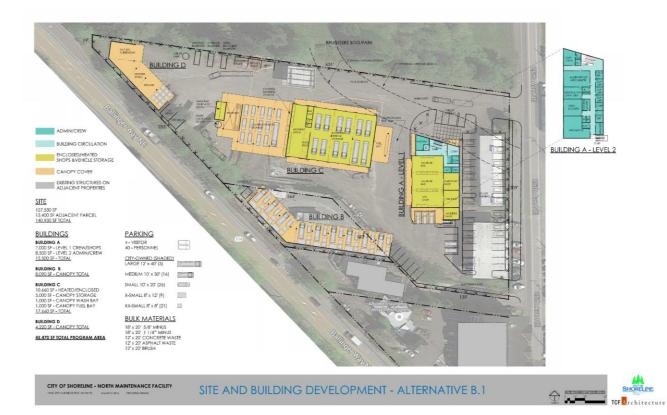

<u>Systems Development:</u> The Mechanical and Electrical engineers met with City representatives to discuss mechanical, electrical, plumbing, security and communication systems to confirm design approach and understand the extent of systems to meet the city's project goals.

<u>Cost Estimate Information:</u> With the information collected from the meeting with the City, BCE provided an estimate for these systems to the project's cost estimator for inclusion into the overall project estimate.

#### CIVIL ENGINEERING (PERTEET)

Expanding on work initiated in the Predesign Phase, Perteet further developed the grading and stormwater pre-design site concepts and updated the cost estimate for these portions of the design. There were some minor modifications to other aspects of the civil design, but the majority of the changes were to the stormwater and grading costs.

<u>Stormwater / Grading Development:</u> Information obtained from the Geotechnical Engineer, as well as the City's consultant on the 25th Avenue NE Flood Reduction project that helped Perteet further develop the stormwater and grading costs. The Geotechnical Engineer was able to perform additional borings on the site and provided information pertaining to

approximate groundwater elevation and the condition of the soil underlying the site (see below), resulting in added dewatering costs and increased costs due to a greater estimated quantity of excavation.

The 25th Avenue NE Flood Reduction project team provided the likely future 2-year storm event water surface elevation of 210.3 as well as the likely future invert elevation of 208.7 just downstream of the North Maintenance Facility site. Preliminary stormwater modeling was performed to size two separate detention vaults on the site as well as two water quality (stormfilter) vaults downstream of the detention vaults. Since the only water surface elevation provided was from the 2-year event, the preliminary layout and elevation of the stormwater system was set such that flow during the 2-year event would not back up in to the two water quality vaults. As designs for both the 25th Avenue NE Flood Reduction project and the North Maintenance Facility progress, continued coordination will be required to make sure the stormwater system on the North Maintenance Facility site function properly during more intense storm events such as the 25 and 100-year event.

<u>Stream / Wetland Buffer:</u> After further discussion with the City of Shoreline planning department, it has been determined, based on the City's Code, that the wetland buffer ends at the existing pavement edge. Therefore, no wetland mitigation is required as long as the project work limits stay within the site boundaries along the wetland edge

#### **GEOTECHNICAL ENGINEERING (TERRACON)**

Terracon provided additional subsurface explorations, analysis and structure-specific recommendations for buildings and retaining structures. The updated information is reflected in the updated designs and cost estimate. A summary of the findings are below.

#### Soil Findings:

- 1. Temporary cut slopes for construction of a wall along SR 104 portion of the site have the potential to undermine the existing gabion wall or trigger slope instability in the WSDOT right-of-way. Terracon recommends significantly limiting the depth and extent of any temporary excavations for retaining wall construction at the toe of this existing steep slope in order to limit the potential for slope instability on the WSDOT right-of-way. It is Terracon's opinion that the soil is not well suited for soil nails. A cantilever soldier pile wall for cuts up to a maximum height of about 10 feet or so, and a soldier pile wall is recommended with permanent tieback anchors for cuts greater than about 10 feet.
- 2. At two test pit locations, some soil with a noticeable hydrocarbon odor was detected. Some of the test pits disclosed pieces of metal, wood, plastic, asphalt, organic material, etc. mixed in with the soil fill. Because of the highly variable and undocumented nature of the fill, it is recommended that the buildings not be supported directly on the existing fill.

#### **Ground Improvement at Buildings:**

There are three basic approaches to providing a good subgrade for foundation and floor slab support in the building areas:

- 1. Overexcavate and remove the existing fill and highly organic soil and replace the removed soil with compacted structural fill;
- 2. Implement some type of ground improvement such as rammed aggregate piers, geopiers, etc. that effectively improves the poor soil and helps transfer the building loads down to more competent soil layers at depth; or
- 3. Provide pile support for the building and slab.

Installation of ground improvement such as rammed aggregate piers, geopiers, or similar contractor-designed ground improvement techniques could be implemented within the building footprints for support of both the building and floor slabs. It is expected that this alternative will be more economical than overexcavation and removal of the existing fill and backfilling with compacted structural fill given the depth involved and the presence of groundwater in the overexcavation.

#### Ground Improvement at Pavement:

For planning purposes, a minimum one-foot thickness of compacted granular fill as subbase beneath the pavement section is assumed. In areas of fill this could be satisfied by the placement and compaction of good quality fill. In cut areas, it may require cutting an additional foot of material in order to accommodate the suggested subbase layer. During construction it is also likely that there may be localized areas of poor subgrade that could require overexcavation and removal.

Differential settlement resulting from consolidation of the poor soil at the depth that is not removed has the potential to be more noticeable in terms of cracking and distress of the rigid PCC pavement. This presents a cost / risk / performance issue that needs to be considered by the design team and the City. Post-construction differential settlement of paved areas can be reduced by delaying the time between fill placement and paving to allow a portion of the settlement to occur prior to paving. The integrity of a PCC pavement section can be improved by thickening the PCC section and adding additional reinforcement and placing a thicker section of base course material below the PCC.

#### Use of Cut Soil:

Only very limited areas of the site contain cut soil that would be suitable for use as structural fill under most conditions. The majority of the soil to be cut is silty sand. During wet weather construction it would not be practical to use this silty material because of its sensitivity to moisture. During dry weather, the silty sand could potentially be useable for use as structural fill on the site provided it is at the proper moisture content, can be effectively segregated from the unsuitable soil, and can be placed and properly compacted. Given the potential difficulty and uncertainty with the reusing the on-site soil for structural fill, it is recommended that the cut soil be removed from the site for preliminary estimating purposes

#### **COST ESTIMATING (THE ROBINSON COMPANY)**

The Robinson Company provided cost estimating services for Preliminary Schematic Level design documentation to establish overall cost budgets for all site and building elements (based on public works bidding and prevailing wage process), estimated off-site costs, FF&E (fixtures, furnishings & equipment), soft costs (sales tax, professional services, permits, etc.), construction contingencies, and escalation factors. Cost estimates for civil systems, mechanical, plumbing, fire protection and electrical systems and landscaping were provided to The Robinson Company by the consultants for incorporation into the total project estimate.

#### **PROJECT ECONOMICS**

Preliminary schematic design level cost estimates were developed for Alternative B.1 and Alternative B, providing a budgetary financial baseline for use in decision-making. The budgetary estimates are summarized below in tables 1 and 2. Escalation is included in the costs through July 2017. Add escalation at minimum 3-4% per year beyond July 2017. See additional break down of cost in section 2a of this report.

Table 1 – Alternative B.1 Budgetary Cost Estimate (Includes additional south parcel)

Description	Estimate	Notes
Site Development	\$7,376,647	Retaining wall, grading, site utilities, paving and street improvements, etc
Building A	\$4,771,519	Admin/Crew/Shops
Building B	\$827,901	Vehicle and materials storage
Building C	\$3,224,893	Vehicle and materials storage, fuel and wash
Building D	\$363,436	Bulk materials storage
Deicer Tank Equip	\$15,000	Equipment for deicer operation
Cost Reduction	\$532,059	Geopiers in lieu of overexcation at buildings
Subtotal Direct Costs	\$16,047,337	MACC (Construction costs)
Soft Costs Budget	\$6,579,408	Sales tax, professional services, construction contingency, permits, etc
Subtotal with Soft Costs	\$22,626,746	
Land acquisition	\$650,000	Preliminary budget only
Furnishings and Technology	\$90,000	Preliminary budget only
B.1 Budgetary Estimate	\$23,371,746	

Table 1 – Alternative B Budgetary Cost Estimate (Does not include acquisition of the south parcel)

Description	Estimate	Notes
Site Development	\$7,076,647	Retaining wall, grading, site utilities, paving and street improvements, etc
Building A	\$4,771,519	Admin/Crew/Shops
Building B	\$531,492	Vehicle and materials storage, reduced square footage
Building C	\$3,224,893	Vehicle and materials storage, fuel and wash
Building D	\$363,436	Bulk materials storage
Deicer Tank Equip	\$15,000	Equipment for deicer operation
Cost Reduction	\$532,059	Geopiers in lieu of overexcation at buildings
Subtotal Direct Costs	\$15,450,929	MACC (Construction costs)
Soft Costs Budget	\$6,334,881	Sales tax, professional services, construction contingency, permits, etc
Subtotal with Soft Costs	\$21,785,809	
Land acquisition	\$0	
Furnishings and Technology	\$90,000	Preliminary budget only
B Budgetary Estimate	\$21,880,809	

# 2A - PROJECT ECONOMICS

This section includes preliminary SD cost estimate summaries and detailed estimate sheets.

- METAL ROOF PANEL SYSTEM BY METAL **BUILDING MFR**
- 1.5" THERMAL BLOCKS (R-3.5 MIN) ON TOP
- OF ROOF PURLINS & INSULATION. 3.5" BATT INSULATION COMPRESSED, LAP
- OVER ROOF PURLINS (R-11 MIN) 4. FILL ROOF PURLIN CAVITY WITH BATT INSULATION (1) 3.5" LAYER OF BATT INSULATION (R-11), ON TOP OF (1) 8" LAYER OF BATT INSULATION (R-25). TOTAL ASSEMBLY R-50.5. SEE ROOF TYPES FOR DETAILED CALLOUTS.
- ROOF PURLINS BY METAL BUILDING MFR CONTINUOUS MEMBRANE BANDED LINER SYSTEM, AT ENDS WRAP UP LINER TO CREATE A CLEAN FINISH. TO MEET ALL ENERGY CODE REQUIREMENTS AND ASTM
- 7. METAL LINER PANEL

## ROOF TYPE BUILDINGS B, C, & D CANOPY & OVERHANG

### ASSEMBLY

- STANDING SEAM METAL ROOF PANEL SYSTEM
- THERMAL BLOCKS ON TOP OF ROOF PURLINS & INSULATION.
- 2" BATT INSULATION, LAP OVER ROOF PURLINS
- POLYETHYLENE SUPPORT FABRIC & STRAPPING SYSTEM (METAL BUILDING SYSTEM INSULATION ENERGY SAVER SUPPORT FABRIC AND STRAPPING). FIRE RETARDANTS: FLAME SPREAD INDEX OF 25 OR LESS; SMOKE DENSITY INDEX OF 50 OR LESS, BASED ON ASTM E-84.
- ROOF PURLINS BY METAL BUILDING MFR STEEL FRAME BY METAL BUILDING MFR.
- BIRD SPIKES ON BOTTOM FLANGE
- FULL DEPTH INSULATION WHERE SHOWN

# 2c - Supplemental Geotechnical Memo

O'	1	FI	D١	/1	F١	٨
U	V		К١	vi	E١	٧V

Included in this section is supplemental Geotechnical information discovered during this scope of work.

Date: August 16, 2016

To: Mark Hurley

**TCF Architecture PLLC** 

From: Dennis Stettler

Tori Hesedahl

**Subject:** Summary of Findings and Recommendations

**Shoreline North Maintenance Facility** 

Shoreline, WA

This memorandum is intended to summarize Terracon's recent email communications with the design team regarding additional explorations performed since issuing our pre-design report. Questions addressed in our communications included:

- Reuse of onsite soil for structural fill
- Ground improvement
- Pavement support
- Design of underground structures
- Retaining walls

### **Summary of observations from explorations**

Eight test pit explorations were advanced. Near the truck scales, in test pits TP-4, TP-5, and TP-6, a thin (approximately 3" thick) layer of soil was that appeared oily and with a strong hydrocarbon odor was observed immediately below the pavement. Garbage and debris was encountered in test pits TP-2, TP-3, TP-6, TP-7, and TP-8. This material included plastic bags, wood, metal, asphalt, and bricks.

Samples from test pits TP-4 and TP-5 were sent for laboratory analysis and were found to have diesel- and oil-range total petroleum hydrocarbons (TPH) detections that exceed the Model Toxics Control Act (MTCA) Method A cleanup levels (2,000 mg/kg for diesel-range TPH and 2,000 mg/kg for oil-range TPH). These samples were collected from directly beneath the asphalt pavement, and may have been an oil treatment to the soil prior to paving, or perhaps a dust control application applied sometime before the site was paved with asphalt. Follow up test results for related contaminants, PAHs, metals, and PCBs specifically, indicated levels below MTCA cleanup levels.

A series of three borings was advanced along Ballinger Way to investigate soils behind the proposed retaining wall. Fill was observed over glacially-consolidated, fine-grained soil. Groundwater was not observed in any of the three borings.

Terracon Consultants, Inc. 21905 64th Avenue West, Suite 100 Mountlake Terrace, Washington 98043 P [425] 771 3304 F [425] 771 3549 terracon.com

Shoreline North Maintenance Facility Shoreline, Washington August 16, 2016 Terracon Project No. 81155070

### Reuse of onsite soil

Only very limited areas of the site contain cut soil that would be suitable for use as structural fill under most conditions. The cut soil often consists of existing fill of highly variable quality and consistency. Some areas of the existing fill contain construction debris or organic materials that would be clearly unsuitable for reuse as fill. The majority of the soil to be cut is silty sand. During wet weather construction it would not be practical to use this silty material because of its sensitivity to moisture. During dry weather, the silty sand could potentially be useable for use as structural fill on the site provided it is at the proper moisture content, can be effectively segregated from the unsuitable soil, and can be placed and properly compacted. Given the potential difficulty and uncertainty with the reusing the on-site soil for structural fill, we recommend assuming for preliminary cost estimates that the cut soil be removed from the site.

### **Ground Improvement**

There are three basic approaches to providing a good subgrade for foundation and floor slab support in the building areas:

- 1) overexcavate and remove the existing fill and highly organic soil and replace the removed soil with compacted structural fill;
- implement some type of ground improvement such as aggregate piers, geopiers, etc. that
  effectively improves the poor soil and helps transfer the building loads down to more
  competent soil layers at depth;
- 3) provide pile support for the building and slab.

Overexcavation and removal of the existing fill and replacement with compacted structural fill is commonly used to address relatively shallow depths of unsuitable soil. In some areas of this site where fill is more shallow this approach could be cost effective. However, for this site we often observed deeper fill and groundwater within the peat or organic soils that would need to be removed. Groundwater control would need to be a component of the overexcavation and backfill process. The groundwater will require groundwater control to accomplish the excavation and removal, and portions of the excavated soil would be quite wet and more difficult to handle. It should be assumed that backfill of the excavations would require imported granular material. Given the depth of overexcavation that is required in some areas, the presence of groundwater, and the need to remove most of the unsuitable soil from the site and replace it with imported structural fill, we expect that this alternative would be more expensive than ground improvement.

Installation of ground improvement such as aggregate piers, geopiers, or similar contractor-designed ground improvement techniques could be implemented within the building footprints for support of both the building and floor slabs. We expect that this alternative will be more economical than overexcavation and removal of the existing fill and backfilling with compacted structural fill given the depth involved and the presence of groundwater in the overexcavation. The selected ground improvement technique would need to capable of installation through saturated soil and groundwater. Ground improvement is typically a design-build element that is

Shoreline North Maintenance Facility Shoreline, Washington August 16, 2016 Terracon Project No. 81155070

designed by a professional engineer working for the specialty ground improvement contractor and constructed by the specialty contractor to achieve a specified performance criteria of allowable bearing pressure and maximum settlement.

Pile foundations are often used for foundation support in areas of deep unsuitable soils. In our opinion, pile foundation support at the relatively shallow depths at this site would likely be more expensive than the ground improvement alternative.

Given the above, we suggest assuming ground improvement beneath building areas for purposes of developing the preliminary cost estimate. Specific comments are provided below for each building:

Building A: Assume ground improvement as noted in the preliminary foundation plans.

Building B: This building is on the property parcel that is planned to be acquired. Terracon has not completed any explorations on this property to evaluate the expected foundation conditions. The note on the preliminary structural foundation plans states that no overexcavation is required per the soils report. Our preliminary geotechnical report dated 2/25/16 did not address a building on the new property. Explorations on the SNMF site just to the north of the new parcel property line disclosed unsuitable soil (including fill and organic soil) generally consistent with other portions of the SNMF property. The new parcel is topographically higher and may be better ground. However, it is clear to us that the entire area including the SNMF and surrounding areas have been subject to significant grading in the past, which brings considerable uncertainty as to the actual soil conditions on the property to be acquired. Because of the lack of information, we suggest assuming conservatively for purposes of the preliminary cost estimate that the soil conditions on the property to be acquired could be similar to the conditions disclosed on the SNMF property directly to the north. In that case, we suggest assuming at this time (until explorations can be advanced on the property to evaluate the actual soil conditions) that ground improvement could be required within Building B.

Building C: The note on the preliminary structural foundation plan states that no excavation is required at this building per the geotechnical report. That statement is not consistent with the findings of our site explorations or our geotechnical report. Soil disclosed in our explorations within and adjacent to Building C disclosed variable quality of fill (including significant quantities of debris in one of the recent test pits near the west side of the building) and buried peat near the east end of the proposed building. We recommend that it be assumed that ground improvement would be required for this entire building.

Building D: The note on the preliminary structural foundation plans identifies the need for overexcavation and replacement or geopiers. We concur based on the available information at that location.

Shoreline North Maintenance Facility Shoreline, Washington August 16, 2016 Terracon Project No. 81155070

Preliminary structural design has assumed 2,500 psf bearing pressure. This is probably conservative and a higher bearing pressure could be used for design, although assuming the lower bearing pressure (and therefore wider footings) may be appropriate for purposes of the preliminary cost estimate.

### **Pavements**

At a minimum, we suggest for planning purposes to including a minimum one foot thickness of compacted granular fill as subbase beneath the pavement section. In areas of fill this could be satisfied by placement and compaction of good quality fill. In cut areas, it may require cutting an additional foot of material in order to accommodate the suggested subbase layer. During construction it is also likely that there may be localized areas of poor subgrade that could require overexcavation and removal.

The existing material, particularly where the buried peat and organic soil is present, can be subject to settlement, especially when up to 7 feet of new fill is placed above it. Within the building areas we have recommended use of ground improvement such as geopiers and leaving the poor materials in place (or alternatively the poor materials could be overexcavated, removed, and replaced with compacted structural fill, although we expect that alternative is likely more expensive than ground improvement). In the car parking areas east of the building, we note that a stormwater vault covers most of this area. For other areas of pavement, these areas can be subject to settlement.

For a typical parking lot with asphalt pavement, the typical approach would be to leave the poor material in place, place well-compacted fill as needed to raise site grades, and accept that the area could be subject to settlement. The pavement settlement could be reduced by filling this area early in the construction project and then delaying paving to allow a significant portion of the settlement to occur prior to paving. Some long-term settlement could still be expected. For typical asphalt-paved areas with a significant thickness of new compacted fill, the differential settlement is likely to be gradual and the tendency of asphalt pavement to be somewhat flexible tends to readily accommodate some settlement without significant cracking or pavement damage. Given the cost of removing the poor soil and replacing it with compacted structural fill in paved areas, it is typically more common to leave the material in place and accept that some long-term settlement may occur. It is important that the owner participate in that decision, but most owners see this as a viable approach when considering the cost.

The plans to use more rigid PCC pavement at the SNMF changes the consideration of long term settlement somewhat. Differential settlement resulting from consolidation of the poor soil at depth that is not removed has the potential to be more noticeable in terms of cracking and distress of the rigid PCC pavement. This presents a cost / risk / performance issue that needs to be considered by the design team and the owner.

Shoreline North Maintenance Facility Shoreline, Washington August 16, 2016 Terracon Project No. 81155070

Measures to mitigate effects of settlement should be considered. Post-construction differential settlement of paved areas can be reduced by delaying the time between fill placement and paving to allow a portion of the settlement to occur prior to paving. The integrity of a PCC pavement section can be improved by thickening the PCC section and adding additional reinforcement and placing a thicker section of base course material below the PCC. These steps do not reduce the settlement, but tend to make the PCC pavement better able to span over localized areas of poor, settlement prone soil and likely reduce (but not eliminate) the potential for damaging differential settlement.

If the owner or design team is concerned about the potential for damaging differential settlement of PCC paved areas, the existing fill and organic material could be removed and replaced with compacted structural fill or the entire site could be subjected to ground improvement similar to that planned for the building areas. Either of these alternatives would be expensive and may not be warranted, but would be viable alternatives to address the potential for differential settlement of the PCC pavement. This topic probably warrants more discussion with the design team and owner regarding the cost / risk / performance trade-offs.

### **Underground Structures**

The need to over-excavate beneath underground stormwater vaults depends on planned subgrade elevation and elevation of each vault. In the area of both of the planned vaults there is unsuitable soil at variable depths. We would be most concerned about not constructing the concrete vaults above highly organic soils. For the planned western vault, organic soils were not observed in our exploration at that location, but other nearby explorations disclosed organic soil as deep as about Elevation 210.5 feet. At the location of the proposed eastern vault, some explorations did not encounter compressible soil while other explorations disclosed compressible organic soil as deep as about Elevation 207.5 feet. Another consideration for the stormwater vaults is the buoyant forces due to the high groundwater table. Groundwater elevations observed in our borings in the vicinity of the proposed stormwater vaults were as high as about Elevation 216 feet.

### **Retaining Walls**

Fill walls could be ultrablock gravity walls or one of the many varieties of mechanically stabilized earth walls. We tend to see those wall types be more economical than concrete cast in place walls, although concrete cast in place walls could be used.

For cut walls of low height (about 8 feet or less) around the perimeter of the site (excluding the side of the site paralleling SR 104), typical ultrablock gravity walls, or cast in place concrete walls could be used.

Cut walls along the property line paralleling SR 104 are a different issue. The ground slopes relatively steeply up to SR 104 and along some portions of the slope a gabion wall is already present. Temporary cut slopes for construction of a wall along this portion of the site have the

Shoreline North Maintenance Facility Shoreline, Washington August 16, 2016 Terracon Project No. 81155070

potential to undermine the existing gabion wall or trigger slope instability in the WSDOT right-ofway. We recommend significantly limiting the depth and extent of any temporary excavations for retaining wall construction at the toe of this existing steep slope in order to limit the potential for slope instability on the WSDOT right-of-way.

Based on the series of three borings along Ballinger Way, it is our opinion that the soil is not well suited for soil nails. We recommend a cantilever soldier pile wall for cuts up to a maximum height of about 10 feet or so, and a soldier pile wall with permanent tieback anchors for cuts greater than about 10 feet. Based on correspondence with WSDOT regarding permanent tieback anchors (email, July 6), WSDOT has allowed permanent tiebacks for these types of situations in the past and it should be possible to work through the easement and permit process with WSDOT during design.

This memorandum is intended to supplement our preliminary design recommendations, but is still considered preliminary and not intended for final design. Once the project configuration is finalized, it is intended that Terracon complete geotechnical engineering and environmental analyses and prepare a design phase geotechnical engineering report for the project. In the meantime, please contact us if you have any questions regarding this preliminary information.

Notes:

### **Building Systems Review Meeting**

Date: July 7, 2016

Project Name: City of Shoreline North Maintenance Facility

TCF Architecture Project Number: 2015-016

### Attendance:

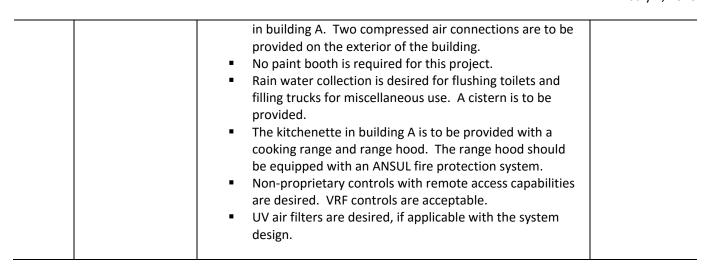

Name	Representing	Role
Noel Hupprich	City of Shoreline	Project Manager
Dan Johnson	City of Shoreline	Central Services Manager
Katherine Moriarty	City of Shoreline	IT Manager
Mark Hurley	TCF Architecture	Project Architect
Chuck Heaton	BCE Engineers	Electrical Engineer
Jeff Hardwick	BCE Engineers	Mechanical Engineers

Minutes Distribution: All in attendance

### Action Items:

Item #	Topics/Discussions	Discussions/Action/Status/Follow-up	Responsibility/	
			Due Date	
1. MEP	. MEP, Security and Communications Systems			
1.1	Discussions	<ul> <li>CCTV cameras at gates, fuel, hazmat bunker and equipment canopy. No interior cameras.</li> <li>Access control at all building exterior doors only.</li> <li>Generator at a minimum to serve fuel, com rooms, egress lighting, site lighting and crew lockers rooms.</li> <li>Data is 2 jacks standard with Cat 6 wiring.</li> <li>Intrusion alarms at all buildings, exterior doors, glass breakage and motion sensors.</li> <li>Vehicle maintenance does not include any fuel component tear down.</li> <li>Site conduit to existing fiber box. No copper backbone required.</li> <li>A PV array is desired, mainly for perception. It should be visible from the street, either rooftop or pole mounted. 20KW capacity would be preferred, but smaller PV and/or infrastructure to support future PV are also to be considered depending on budget.</li> <li>The Fab shop in building A should get both a welding hood (sized at 4'x4' or 6'x6') and a welding exhaust snorkel hood for flexibility.</li> <li>One hose reel of vehicle exhaust is to be provided between the multi-use bays in building A.</li> <li>The carpentry shop will have contractor furnished shop equipment and will require a sawdust collection system. There will likely be 3 connection points serving a chop saw, table saw and jointer.</li> <li>No lube reels are required for this project.</li> <li>Compressed air is to be provided to serve building A. One drop is to be provided at each vehicle bay and each shop</li> </ul>

Minutes by Mark Hurley TCF Architecture, PLLC

### **END OF MEETING MINUTES**

If any information contained in these minutes does not meet with your understanding, please provide written comments stating any differences, or exceptions taken, to TCF Architecture PLLC prior to the next meeting. Revisions and clarifications to these notes will be formally made at the following meeting. In the event no exceptions are taken within one calendar week, TCF Architecture will assume that these minutes reflect a true and accurate record of the meeting.

(Note: Follow-up information or status updates, not specifically discussed at the meeting, may be included herein and identified as such.)

To: Noel Hupprich, Capital Project Manager, City of Shoreline

Re: City of Shoreline North Maintenance Facility – Third Party Critical Areas Documentation Review

### **PROJECT DESCRIPTION**

The property is located at 19547 25<sup>th</sup> Ave NE, Shoreline, Washington on Parcel # 0426049043 approximately 350 feet north of the intersection with Ballinger Way NE. The City is proposing to develop the parcel and construct the North Maintenance Facility project (proposed project). Critical areas features present on the City-owned Brugger's Bog Park (city park; Parcel #0426049049) at 19553 25<sup>th</sup> Ave NE adjacent to and immediately north of the proposed project contain critical areas with buffers that extend onto the proposed project parcel. The City retained Perteet, Inc. to conduct a third party review of the project's wetland and stream delineation reports and to review the Shoreline Municipal Code Chapter 20.80 Critical Areas to more precisely clarify the presence and extent of critical areas features and buffers overlapping the proposed project as described in the delineation report prepared by the Watershed Company.

### **DOCUMENTS REVIEWED**

The following resource information, websites, and documents were reviewed by Perteet:

- City of Shoreline Maintenance Facility Wetland and Stream Delineation Report; prepared by The Watershed Company, September 3, 2013.
- City of Shoreline Maintenance Facility, Wetland and Stream Delineation Report; prepared by The Watershed Company, September 3, 2013, revised April 18, 2016.
- Existing Conditions Land Survey, City of Shoreline Bruggers Bog Maintenance Facility; prepared by WH Pacific, plotted January 15, 2014.
- Shoreline City Council Agenda Item 8(d) Authorizing the City Manager to Execute a Purchase/Sale Agreement with King County for the Brugger's Bog Maintenance Facility in the amount of \$2,898,622 and to Pursue the Required Financing for the Acquisition; City of Shoreline City Council, November 26, 2012.

### **BACKGROUND REVIEW AND SITE RECONNAISSANCE**

The City contracted with The Watershed Company to conduct a critical areas survey of the proposed project and adjacent City park parcels to define the critical areas constraints on the proposed project. The Watershed Company completed a wetland and stream delineation in 2013 (Watershed Co. 2013). Updates to the City's critical areas ordinance since 2013 potentially affected the proposed project. In early 2016, the City requested The Watershed Company to update the 2013 report to comply with the current ordinance (Watershed Co. 2016). Those investigations found no critical areas present on the proposed project parcel, but identified one wetland and one stream on the adjacent city park parcel. The Watershed Company drew wetland and stream buffers that extend onto the proposed project parcel projecting from these off-site features. The City retained Perteet to review The Watershed Company's conclusions and review the Shoreline Municipal Code Chapter 20.80 Critical Areas to independently evaluate the presence and extent of buffers overlapping the proposed project parcel.

Perteet ecological staff completed a document review and site reconnaissance of the two parcels on June 20, 2016. A review of the municipal code and publicly available natural resources databases was completed on June 21, 2016. One wetland (Wetland A) and one stream (Ballinger Creek) were observed and confirmed on the city park parcel in the approximate extents mapped by The Watershed Company.

Ballinger Creek is the identified stream. It is a perennial stream tributary to Lyon Creek that eventually drains into McAleer Creek and Lake Washington. It is located in WRIA #8 Cedar-Sammamish. No stream ordinary high water mark (OHWM) flags could be relocated to confirm The Watershed Company's stream boundary lines. The stream reach documented in the critical areas report is a moderately well intact, fully shaded pool and riffle system with a fine sediment bed and bank stabilized by native and non-native vegetation on a shallow slope. Direct evidence of recent overbank flooding (matted down herbaceous vegetation) was observed along the stream reach. The stream's contributing basin is 90+% high density suburban residential and retail. WDFW's SalmonScape mapping tool illustrates the lowest reach of Ballinger Creek to contain documented presence of coho salmon (*Oncorhynchus kitsutch*). The salmonid containing reach is over 800 feet downstream of the project area below several partial and total fish passage barriers and culverts. The stream exits Wetland A as it flows under a dense Himalayan blackberry (*Rubus armeniacus*) thicket for about 100 feet before entering two 24-inch corrugated metal culverts near the southeast corner of the park parcel. The stream drains several hundred feet through culverts southeasterly beyond the project area and east of 25<sup>th</sup> Ave NE. The Perteet site reconnaissance was not tasked with determining fish presence or use in the stream or a detailed description of the stream and riparian corridor.

Wetland A is a forested wetland with a combination of riverine and palustrine Cowardin systems extending along both sides of Ballinger Creek within the study area and approximately corresponds to The Watershed Company critical areas report findings. Two wetland boundary flags were located on the south edge of Wetland A nearest the existing oil house on the project parcel. The forested wetland remains relatively intact with multiple vegetation strata containing native and non-native species. The riverine portion of Wetland A extends along both sides of Ballinger Creek and contains observed evidence of matted down herbaceous vegetation indicating recent overbank flooding. Overflow channels and small puddles from Ballinger Creek are present along Wetland A, indicating it is sustained by the creek. The palustrine portion of Wetland A comprises much of the southern-most section of Wetland A and is dominated by darker saturated soils and free water at the soil surface. Vegetation throughout the wetland is dominated by various willows (Salix sp.), red alder (Alnus rubra), and paper birch (Betula papyrifera) in the tree and shrub layers. Spiraea (Spiraea douglasii), red-osier dogwood (Cornus alba), Himalayan blackberry, salmonberry (Rubus spectabilis), black twinberry (Lonicera involucrata) dominate the lower shrub stratum. The herbaceous stratum is dominated by creeping buttercup (Ranunculus repens), field horsetail (Equisetum arvense), various sedges (Carex sp.), small fruited bulrush (Scirpus microcarpus), woolgrass (S. cyperinus), reed canarygrass (Phalaris arundinacea), mannagrass (Glyceria sp.), soft rush (Juncus effusus), and skunk cabbage (Lysichiton americanus).

Uplands around the stream and wetland are a mix of mowed park lawn and a fringe of native and non-native trees and shrubs to the north, northeast, south, and west. A dense thicket of Himalayan blackberry outcompetes most other vegetation southeast of Wetland A.

One unmaintained vegetated ditch documented in The Watershed Company critical areas report was identified along the boundary line between the proposed project and the park parcels. The ditch begins about 150 feet east of the mutual western corner of the two parcels and drains east to Ballinger Creek upstream of the dual culverts. The ditch is mostly filled in with organic debris and is overgrown with various wetland and upland native and non-native herbaceous, shrub, and tree species. Soils and organic debris were moist in a couple locations along the ditch.

Perteet reviewed the rating and buffer conclusions presented in The Watershed Company's critical areas report and compared them against the city's critical areas municipal code. The downstream presence of salmonids and other fish in Ballinger Creek does classify the upstream portions of Ballinger Creek, regardless of fish passage barriers, as a Type F (fish-bearing) stream that receives a 115 foot standard buffer width. Perteet independently rated Wetland A using Washington Department of Ecology's updated 2014 Western Washington Wetland Rating System and found Wetland A to receive a Category II rating with a standard buffer width of 105 feet based on a rating habitat score of 5. Our rating form is appended to this memo.

### **FINDINGS**

- 1. The stream does extend a few feet onto the proposed project parcel at the parcel's very northeast corner according to the WH Pacific topographic land survey. Depending on the proposed project design, project related direct impacts to the stream or stream buffer may or may not occur at that location and should be verified by the design team.
- 2. The Wetland A delineation boundary generally appears to follow breaks in the topographic slope based on the few delineation boundary flags that could be relocated. Along the north boundary (left side of stream) and the northwest boundary (right side of stream) the delineation boundary line appears to be relatively accurate.
- 3. The stream buffer determination of 115 feet is correct. The mapped extents of the stream buffer in the critical areas report figures is not accurate as discussed in the Recommendations section below.
- 4. The Wetland A rating per Ecology's 2014 rating system is correct; however, the <a href="https://habitat.score">habitat score</a> was observed to warrant a 5 point score by Perteet compared to 6 points given by The Watershed Company. The discrepancy appears to be the last habitat question related to Priority Habitats or Features present. Priority snags and logs of sufficient size to meet the criteria were not located. A single large log found in the stream meets the diameter but not the length requirement of the priority snags and logs category. The City of Shoreline buffer for this habitat score would decrease from 165 feet (Cat. II with habitat score of 6 or 7) documented in critical areas report to 105 feet (Cat. II with habitat score of 5).
- 5. The mapped extents of the Wetland A buffer in the critical areas report figures is not accurate as discussed in the Recommendations section below.

### **RECOMMENDATIONS**

The Watershed Company Wetland and Stream Delineation Report minimally documents the existing critical areas present on the proposed project's adjacent city park parcel that contain critical area buffers that may extend onto and affect the proposed project parcel. The mapped boundaries of the critical areas appear to be approximately accurate.

The critical areas report figure also illustrates that critical areas buffers extend onto the proposed project parcel. The critical areas code Chapter 20.80.040 Subpart C "Allowed Activities" states the following:

1. **Modifications to Existing Structures within Critical Areas.** Structural modification of, addition to, maintenance, repair, or replacement of legally nonconforming structures consistent with SMC20.30.280, which do not meet the building setback or buffer requirements for wetlands, fish and wildlife habitat conservation areas, or geologic hazard areas if the modification, addition, replacement or related activity does not increase the **existing** building footprint of the structure or **area of hardscape** lying within the

critical area or buffer. Within landslide hazard areas additions that add height to a nonconforming structure may only be allowed with review of a critical area report demonstrating that no increased risk of the hazard will occur. Where nonconforming structures are partially located within critical areas or their buffers, additions are allowed with a critical area report delineating the critical area(s) and required buffers showing that the addition is located entirely outside the critical area or buffer;

Pursuant to our interpretation of the City of Shoreline municipal code for critical areas and buffers allowed activities, the stream and wetland buffers may stop at the vegetated edge of the proposed project parcel's north boundary. From that revised projected buffer edge south, the proposed project parcel is nearly 100% paved hardscape and/or buildings and structures that meets to allowance of Chapter 20.80.040 Subpart C. This has been the existing site condition on the project parcel since at least as early as 1990 as illustrated by historical photography available on Google Earth. No ecological buffer presently exists or has existed in this location presumably since the site was developed and before critical areas regulations were in existence. Impacts to the narrow vegetated buffers between the paved edge and property line along the project parcel's north boundary line, if proposed, are assumed to require mitigation according to the City's critical areas buffer mitigation requirements.

The presence of the stream and culverts at the northeast corner of the project parcel may be impacted by the proposed project and may require impact quantification and mitigation by the City and other agencies depending on the project design at that location. The City is also investigating road corridor upgrades along 25<sup>th</sup> St NE that would include alterations to this culverted reach of Ballinger Creek along and under the street. Depending on proposed road related stream upgrades and timing of the two projects, any necessary mitigation for potential critical areas or buffer impacts could be tied together to provide a greater positive impact on Ballinger Creek and it's riparian corridor.

**END OF MEMORANDUM**

Screen capture of list of TMDLs for WRIA in which unit is found (from web)	L 3.3	

### Slope Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Plant cover of <b>dense</b> trees, shrubs, and herbaceous plants	S 1.3	
Plant cover of dense, rigid trees, shrubs, and herbaceous plants	S 4.1	
(can be added to another figure)		
Boundary of area within 150 ft of the wetland (can be added to another figure)	S 2.1, S 5.1	
1 km Polygon: Area that extends 1 km from entire wetland edge - including	H 2.1, H 2.2, H 2.3	
polygons for accessible habitat and undisturbed habitat		

### Wetland name or number

Screen capture of map of 303(d) listed waters in basin (from Ecology website)	S 3.1, S 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

## **HGM Classification of Wetland in Western Washington**

For questions 1 -7, the criteria described must apply to the entire unit being rated. If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are th	ne water levels in the entire unit usual	ly controlled by tides except during floods?
<b>✓</b>	NO - go to 2	☐ <b>YES</b> - the wetland class is <b>Tidal Fringe</b> - go to 1.1
1.1	Is the salinity of the water during per	riods of annual low flow below 0.5 ppt (parts per thousand)?
<b>V</b>	-	a Freshwater Tidal Fringe use the forms for Riverine wetlands  Estuarine wetland and is not scored. This method cannot be
	ntire wetland unit is flat and precipitat vater and surface water runoff are NC	ion is the only source (>90%) of water to it.  OT sources of water to the unit.
<b>~</b>	NO - go to 3 If your wetland can be classified as	☐ <b>YES</b> - The wetland class is <b>Flats</b> a <i>Flats wetland, use the form for</i> <b>Depressional</b> wetlands.
	· ·	on the shores of a body of permanent open water (without any the year) at least 20 ac (8 ha) in size;
<b>7</b>	NO - go to 4	☐ <b>YES</b> - The wetland class is <b>Lake Fringe</b> (Lacustrine Fringe
		n be very gradual), I in one direction (unidirectional) and usually comes from seeps v, or in a swale without distinct banks.
V	NO - go to 5	☐ <b>YES</b> - The wetland class is <b>Slope</b>
		type of wetlands except occasionally in very small and shallowns are usually <3 ft diameter and less than 1 ft deep).
	from that stream or river,	nnel, where it gets inundated by overbank flooding
	NO - go to 6	☑ YES - The wetland class is Riverine
NOTE: T	The Riverine unit can contain depress	ions that are filled with water when the river is not flooding.

, , ,	ic depression in which water ponds, or is saturated to the surface, a part any outlet, if present, is higher than the interior of the wetland.
✓ NO - go to 7	☐ <b>YES</b> - The wetland class is <b>Depressional</b>
The unit does not pond surface water more	ry flat area with no obvious depression and no overbank flooding? e than a few inches. The unit seems to be maintained by high be ditched, but has no obvious natural outlet.
□ NO - go to 8	YES - The wetland class is Depressional

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

**NOTE**: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit	HGM class to
being rated	use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream	Depressional
within boundary of depression	
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other	Treat as
class of freshwater wetland	ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.

NOTES and FIELD OBSERVATIONS:

Wetland name or number

DEPRESSIONAL AND FLATS WETLANDS			
Water Quality Functions - Indicators that the site functions to improve water quality			
D 1.0. Does the site have the potential to improve water quality?			
D 1.1. Characteristics of surface water outflows from the wetland:			
Wetland is a depression or flat depression (QUESTION 7 on key)			
with no surface water leaving it (no outlet).	points = 3		
Wetland has an intermittently flowing stream or ditch, OR highly			
constricted permanently flowing outlet.	points = 2	1	
☑ Wetland has an unconstricted, or slightly constricted, surface outlet			
, , , , , , , , , , , , , , , , , , , ,	points = 1		
☐ Wetland is a flat depression (QUESTION 7 on key), whose outlet is			
	points = 1		
D 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (use NRCS definitions).	4 N. O	0	
,			
D 1.3. Characteristics and distribution of persistent plants (Emergent, Scrub-shrub, and Forested Cowardin classes):	/Or		
Wetland has persistent, ungrazed, plants > 95% of area	noints - 5		
·	points = 5	5	
Wetland has persistent, ungrazed, plants > ½ of area	points = 3		
Wetland has persistent, ungrazed plants $> \frac{1}{10}$ of area	points = 1		
Wetland has persistent, ungrazed plants < <sup>1</sup> / <sub>10</sub> of area	points = 0		
D 1.4. Characteristics of seasonal ponding or inundation:	- 1		
This is the area that is ponded for at least 2 months. See description in manual		0	
Area seasonally ponded is > ½ total area of wetland	points = 4	2	
Area seasonally ponded is > 1/4 total area of wetland	points = 2		
Area seasonally ponded is < 1/4 total area of wetland	points = 0

Rating of Value If score is: 2 - 4 = H 1 = M 0 = L

Record the rating on the first page

These questions apply to wetlands of all HGM classes.		
HABITAT FUNCTIONS - Indicators that site functions to provide important habitat		
H 1.0. Does the site have the potential to provide habitat?		
H 1.1. Structure of plant community: Indicators are Cowardin classes and strata within the Forested class. Check the Cowardin plant classes in the wetland. Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.		
<ul> <li>□ Aquatic bed</li> <li>□ Emergent</li> <li>□ Scrub-shrub (areas where shrubs have &gt; 30% cover)</li> <li>□ Forested (areas where trees have &gt; 30% cover)</li> <li>□ If the unit has a Forested class, check if:</li> <li>□ The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon</li> </ul>	1	
H 1.2. Hydroperiods Check the types of water regimes (hydroperiods) present within the wetland. The water regime		
has to cover more than 10% of the wetland or $\frac{1}{4}$ ac to count (see text for descriptions of hydroperiods).		
<ul> <li>□ Permanently flooded or inundated</li> <li>□ Seasonally flooded or inundated</li> <li>□ Occasionally flooded or inundated</li> <li>□ Occasionally flooded or inundated</li> <li>□ Saturated only</li> <li>□ Permanently flowing stream or river in, or adjacent to, the wetland</li> <li>□ Seasonally flowing stream in, or adjacent to, the wetland</li> </ul>	3	
<ul><li>□ Lake Fringe wetland</li><li>□ Freshwater tidal wetland</li><li>2 points</li><li>2 points</li></ul>		
☐ Freshwater tidal wetland 2 points H 1.3. Richness of plant species		
Count the number of plant species in the wetland that cover at least 10 ft <sup>2</sup> .  Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle	2	
If you counted: > 19 species points = 2 5 - 19 species points = 1 < 5 species points = 0		
H 1.4. Interspersion of habitats Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. If you have four or more plant classes or three classes and open water, the rating is always high.  None = 0 points  Low = 1 point  Moderate = 2 points	1	
All three diagrams in this row are HIGH = 3 points		

Wetland name or number

11

H 1.5. Special habitat features:	
Check the habitat features that are present in the wetland. The number of checks is the number	
of points.	
☑ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long)	
☑ Standing snags (dbh > 4 in) within the wetland	
☑ Undercut banks are present for at least 6.6 ft (2 m) and/or overhanging plants extends	
at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at	
least 33 ft (10 m)	3
☐ Stable steep banks of fine material that might be used by beaver or muskrat for	
denning (> 30 degree slope) OR signs of recent beaver activity are present ( <i>cut shrubs</i>	
or trees that have not yet weathered where wood is exposed)	
☐ At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas	
that are permanently or seasonally inundated (structures for egg-laying by amphibians)	
☐ Invasive plants cover less than 25% of the wetland area in every stratum of plants (see	
H 1.1 for list of strata)	
Total for H 1 Add the points in the boxes above	10
Rating of Site Potential If Score is:   15 - 18 = H  7 - 14 = M  0 - 6 = L Record the rating on	the first page
H 2.0. Does the landscape have the potential to support the habitat function of the site?	
H 2.1 Accessible habitat (include only habitat that directly abuts wetland unit).	
Calculate:	
% undisturbed habitat + (% moderate & low intensity land uses / 2 ) =	
If total accessible habitat is:	0
$> \frac{1}{3}$ (33.3%) of 1 km Polygon points = 3	
20 - 33% of 1 km Polygon points = 2	
10 - 19% of 1 km Polygon points = 1	
< 10 % of 1 km Polygon points = 0	
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland.	
Calculate:	
% undisturbed habitat + ( % moderate & low intensity land uses / 2 ) =	
<u> </u>	0
Undisturbed habitat > 50% of Polygon points = 3	2
Undisturbed habitat 10 - 50% and in 1-3 patches points = 2	
Undisturbed habitat 10 - 50% and > 3 patches points = 1	
Undisturbed habitat < 10% of 1 km Polygon points = 0	
H 2.3 Land use intensity in 1 km Polygon: If	
> 50% of 1 km Polygon is high intensity land use points = (-2)	-2
≤ 50% of 1km Polygon is high intensity points = 0	
Total for H 2 Add the points in the boxes above	0
Rating of Landscape Potential If Score is:   4-6=H  1-3=M  <<1=L  Record the rating on	the first page
H 3.0. Is the habitat provided by the site valuable to society?	
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? Choose	
only the highest score that applies to the wetland being rated.	
Site meets ANY of the following criteria: points = 2	
☐ It has 3 or more priority habitats within 100 m (see next page)	
□ It provides habitat for Threatened or Endangered species (any plant	
or animal on the state or federal lists)	
□ It is mapped as a location for an individual WDFW priority species	4
☐ It is a Wetland of High Conservation Value as determined by the	1
Department of Natural Resources	
☐ It has been categorized as an important habitat site in a local or	
regional comprehensive plan, in a Shoreline Master Plan, or in a	
watershed plan	
Site has 1 or 2 priority habitats (listed on next page) with in 100m points = 1	

12

Site does not meet any of the criteria above points = 0

## **WDFW Priority Habitats**

<u>Priority habitats listed by WDFW</u> (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.

http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here: http://wdfw.wa.gov/conservation/phs/list/

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: **NOTE**: This question is independent of the land use between the wetland unit and the priority habitat.

	Aspen Stands: Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
	<b>Biodiversity Areas and Corridors</b> : Areas of habitat that are relatively important to various species of native fish and wildlife ( <i>full descriptions in WDFW PHS report</i> ).
	Herbaceous Balds: Variable size patches of grass and forbs on shallow soils over bedrock.
	Old-growth/Mature forests: Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
	<b>Oregon White Oak</b> : Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important ( <i>full descriptions in WDFW PHS report p. 158</i> – see web link above).
7	<b>Riparian</b> : The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
	<b>Westside Prairies</b> : Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie ( <i>full descriptions in WDFW PHS report p. 161 – see web link above</i> ).
7	<b>Instream</b> : The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
	<b>Nearshore</b> : Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. ( <i>full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page</i> ).
	<b>Caves</b> : A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
	Cliffs: Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
	<b>Talus</b> : Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
	<b>Snags and Logs</b> : Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

14

**Note**: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

## **CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS**

Wetland	Туре	Category
Oh I		
	f any criteria that apply to the wetland. List the category when the appropriate criteria are met.	
SC 1.0.	Estuarine Wetlands	
	Does the wetland meet the following criteria for Estuarine wetlands?	
	The dominant water regime is tidal,	
	Vegetated, and	
	With a salinity greater than 0.5 ppt  ☐ Yes - Go to SC 1.1 ☐ No = Not an estuarine wetland	
SC 1.1.	Is the wetland within a National Wildlife Refuge, National Park, National Estuary	
30 1.1.	Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific	
	Reserve designated under WAC 332-30-151?	
	☐ Yes = Category I ☐ No - Go to SC 1.2	
SC 1.2.	Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions?	
	The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing,	
	and has less than 10% cover of non-native plant species. (If non-native species are	
	Spartina, see page 25)	
	At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-	
	grazed or un-mowed grassland.	
	The wetland has at least two of the following features: tidal channels, depressions with	
	open water, or contiguous freshwater wetlands.	
	☐ Yes = Category I ☐ No = Category II	
	Wetlands of High Conservation Value (WHCV)	
SC 2.1.	Has the WA Department of Natural Resources updated their website to include the list	
	of Wetlands of High Conservation Value?	
	☐ Yes - Go to <b>SC 2.2</b> ☐ No - Go to <b>SC 2.3</b>	
SC 2.2.	Is the wetland listed on the WDNR database as a Wetland of High Conservation Value?	
	☐ Yes = Category I ☐ No = Not WHCV	
SC 2.3.	Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland?	
	http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf  ☐ Yes - Contact WNHP/WDNR and to SC 2.4 ☐ No = Not WHCV	
SC 2.4	$\square$ Yes - Contact WNHP/WDNR and to SC 2.4 $\square$ No = Not WHCV Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation	
30 2.4.	Value and listed it on their website?	
	☐ Yes = Category I ☐ No = Not WHCV	
SC 3.0.		
	Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation	
	in bogs? Use the key below. If you answer YES you will still need to rate the	
	wetland based on its functions.	
SC 3.1.	Does an area within the wetland unit have organic soil horizons, either peats or mucks,	
	that compose 16 in or more of the first 32 in of the soil profile?	
	☐ Yes - Go to <b>SC 3.3</b> ☐ No - Go to <b>SC 3.2</b>	
SC 3.2.	Does an area within the wetland unit have organic soils, either peats or mucks, that are	
	less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic	
	ash, or that are floating on top of a lake or pond?	
	☐ Yes - Go to SC 3.3 ☐ No = Is not a bog	
SC 3.3.	Does an area with peats or mucks have more than 70% cover of mosses at ground	
	level, AND at least a 30% cover of plant species listed in Table 4?	
	☐ Yes = Is a Category I bog ☐ No - Go to SC 3.4	
	NOTE: If you are uncertain about the extent of mosses in the understory, you may	
	substitute that criterion by measuring the pH of the water that seeps into a hole dug at	
	least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present,	
SC 3.4.	the wetland is a bog.	
3.4.	Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann	
	spruce, or western white pine, AND any of the species (or combination of species)	

listed in Table 4 provide more than 30% of the cover under the canopy?

☐ Yes = Is a Category I bog ☐ No = Is not a bog

SC 4.0.	Forested Wetlands	
	Does the wetland have at least 1 contiguous acre of forest that meets one of these	
	criteria for the WA Department of Fish and Wildlife's forests as priority habitats? <i>If you</i>	
	answer YES you will still need to rate the wetland based on its functions.	
	, , , , , , , , , , , , , , , , , , , ,	
	forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac	
	(20 trees/ha) that are at least 200 years of age OR have a diameter at breast height	
	(dbh) of 32 in (81 cm) or more.	
	,	ļ
	200 years old OR the species that make up the canopy have an average diameter	
	(dbh) exceeding 21 in (53 cm).	
	= Y	
20.5.0	☐ Yes = Category I ☐ No = Not a forested wetland for this section	
SC 5.0.	Wetlands in Coastal Lagoons  Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?	
	Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?  The wetland lies in a depression adjacent to marine waters that is wholly or partially	ļ
	The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, grayel banks, shingle, or less frequently	
	separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks	ļ
	The lagoon in which the wetland is located contains ponded water that is saline or	
	brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon ( <i>needs to</i>	ļ
	be measured near the bottom)	
	□ Yes - Go to SC 5.1 □ No = Not a wetland in a coastal lagoon	
SC 5.1.	Does the wetland meet all of the following three conditions?	
	The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation,	
	grazing), and has less than 20% cover of aggressive, opportunistic plant species (see	
	list of species on p. 100).	
	At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-	ļ
	grazed or un-mowed grassland.	
	The wetland is larger than $^1/_{10}$ ac (4350 ft <sup>2</sup> )	
	☐ Yes = Category I ☐ No = Category II	
SC 6.0.	Interdunal Wetlands	
	Is the wetland west of the 1889 line (also called the Western Boundary of Upland	
	Ownership or WBUO)? If you answer yes you will still need to rate the wetland	I
	based on its habitat functions.	
	In practical terms that means the following geographic areas:	
	Long Beach Peninsula: Lands west of SR 103	
	Grayland-Westport: Lands west of SR 105	
	Ocean Shores-Copalis: Lands west of SR 115 and SR 109	
	☐ Yes - Go to SC 6.1 ☐ No = Not an interdunal wetland for rating	
SC 6.1.		
	(rates H,H,H or H,H,M for the three aspects of function)?	
	☐ Yes = Category I ☐ No - Go to SC 6.2	
SC 6.2.	5 ,	
	☐ Yes = Category II ☐ No - Go to SC 6.3	
SC 6.3.	·	
	1 ac?	
2-1-20	☐ Yes = Category III ☐ No = Category IV
