Re: Aurora Corridor Project
Value Analysis/Engineering Study

Dear Kris:

Transmitted herewith are 10 copies of the Final Value Engineering Study Report for the Aurora Corridor Project. This final report is incorporates review comments from the City and other stakeholders.

The team appreciates your assistance and cooperation as well as that from the design team personnel and all other stakeholders. Should you have any questions please telephone me at (206) 674-6113.

Sincerely,

Randy Barber, PE, CVS
Principal

Executive Summary

Background

Olympic Associates Company was retained by the City of Shoreline to perform a value engineering (VE) study for the Aurora Avenue Corridor Improvement Project from N 165th to N 185th. Study dates were from April 8-10, 2008, with a presentation to City staff and the HDR design team on Friday, April 11.

Project Description

The project, referred to by City staff as the 'middle mile', abuts the phase 1 project that constructed improvements from N 145th to N 165th on the south, and phase 3 improvements from approximately 500 feet north of N 185th. The project is funded through a variety of sources, including local, state, and federal funding. Design parameters, such as right-of-way width, roadway widths (including lane and median widths), above grade amenities (such as luminaire pole types), etc. from the first phase are being continued in this phase. The access management scheme, such as U-turns and business/access/transit (BAT) lanes, are an integral part of the improvements.

Results and Recommendations

Goals for the study included identifying options to reduce business impacts during construction; identifying low impact development and stormwater options that are cost effective; identifying opportunities to reduce the overall construction schedule; and exploring options to reduce maintenance costs. In addition to these areas, pedestrian circulation, both during and post construction, was a need that was reviewed.

The VE team recommends the following ideas be incorporated into the design documents in order to achieve the City's goals for the project.

- Review opportunities to decrease the contract time. Ideas IE-2, -4, -6, and -7 address this issue.
- Review stormwater flow and treatment options. Ideas AR-2, -5, and -6 address these issues.
- Identify opportunities to improve visibility, safety, traffic control and access during construction. Ideas IE-3, -5, IS-2, -9, and -11 address these issues.

VE Study Team

Facilitator – Randy Barber, PE, CVS

Civil engineers – Jaime Saez, PE (Saez Consulting) and Zach Gray, PE (KPFF)

City representative – Kris Overleese, PE

Construction logistics – Mike Myette, PE (Utility Contractors Association of Washington)

1.2 CREATIVE IDEA LIST

Aurora Ave. Corridor Improvements

N 165th to N 185th

Shoreline, WA

April 2008

The following is a list of ideas and comments that resulted from the VE study shown below. Some of the ideas were selected for further development.

Idea No. = Idea numbers assigned to creative ideas generated during the creative phase.

The VE Team used the following criteria to evaluate the list of ideas.

- Supports community vision and council objectives
- No negative impacts to business operations
- Positively affects safety and operations
- Contributes to environmental impact mitigation

Score = The ideas were scored as follows to prioritize them for further development and documentation

Score	Results
ABD	Already being done
0-n	Number of votes by the VE team
DS	Design Suggestion (No estimate)
FF	Fatal Flaw

Resp. = Team member responsible for documentation.

Functions	AR	Accommodate Runoff
	IE	Improve Efficiency
	IS	Improve Safety
	MI	Miscellaneous

Workbook No = The number assigned to an idea which serves as a key to the Value Improvement Matrix.

WkBk No.	Resp.	Score	Idea No	Description
-----------------	--------------	--------------	----------------	--------------------

Accommodate Runoff

		ABD	1	Comply with runoff water quality standards
AR-2	ZG		2	Review options for a regional approach to stormwater runoff
			3	Purchase a parcel near Boeing Creek for water quality improvements
AR-			4	Use a portion of Boeing Creek Park as a water quality feature
AR-5	ZG	DS	5	Use ecology embankments within the median
AR-6	JS	2	6	Bore through the glacial til strata to unsaturated outwash for infiltration
AR-		FF	7	Incorporate opportunities for porous pavement use
AR-			8	Install a conventional storm drain system
AR-			9	Utilize the Langeberg property for water quality feature
AR-10	KO	DS	10	Use Langeberg property for laydown/staging

Creative Idea Not Developed

IE-1	MM		11	Assign a utility coordinator
IE-2	JS	DS	12	Identify staging areas within project limits
IE-3	MM		13	Have contractors develop a traffic control plan
IE-4	JS		14	Develop sequencing plan for the overall construction

1.2 CREATIVE IDEA LIST

FUNCTION: Accommodate Runoff		IDEA # 2, 3, 4
TITLE: Review options for a regional approach to stormwater runoff		
BASELINE DESIGN ASSUMPTION		
Water quality treatment of stormwater runoff is handled mostly through the use of the Filterra filtration system. Approximately 93 Filterra units are currently proposed for mile-long project.		
PROPOSED ALTERNATIVE		
Review options for a regional stormwater runoff facility to address flow control and water quality. The VE team considered 4 options, with order of magnitude pricing in Appendix A to this workbook. 1. Use portion of Boeing Creek for stormwater runoff treatment. 2. Purchase parcel near Boeing Creek to provide treatment opportunities. 3. Explore other options for regional stormwater treatment facility. 4. Explore conventional treatment system (ie, wet vault) within corridor print.		
DISCUSSION		
<p>This project is not required to provide stormwater treatment per the current regulations in place. The City has indicated a desire to incorporate sustainable and low impact development techniques into the project regardless of whether or not they are required. The benefit to cost ratio of the Filterra units is low in comparison to other potential treatment alternatives that may be available elsewhere in the project drainage basin (Ph 1 stormwater treatment costs ~\$350,000 vs. the estimated \$1,000,000+ for Filterra units). Options to mitigate project stormwater runoff and associated water quality LID's should be explored elsewhere where more benefit can be acquired with the same cost. Filterra systems have an advantage in maintenance costs. Maintenance required for these units should be considerable in comparison to other possible options within the Boeing Creek drainage basin.</p> <p>The cost to install the Filterra system is estimated to be just over \$1,000,000. Cost could be added to stormwater improvements already slated for Boeing Creek Park or added to another potential system to be located either within the project limits or off-site within the basin area.</p>		
ADVANTAGES		DISADVANTAGES
<ul style="list-style-type: none"> • Potential to provide more runoff treatment than just the Aurora Corridor 	<ul style="list-style-type: none"> • Usable land and property may not be available to provide function 	
<ul style="list-style-type: none"> • Reduces total number of facilities having to be maintained 	<ul style="list-style-type: none"> • Potential constraints with funding an off-site facility as part of this project 	
<ul style="list-style-type: none"> • Increased benefit to surrounding bird and wildlife 	<ul style="list-style-type: none"> • Goes against City desire to see LID devices within corridor 	
<ul style="list-style-type: none"> • Project landscape pallet and plant selection is not driven by specific plant species required to be planted within Filterra unit 	<ul style="list-style-type: none"> • 	
RECOMMENDATION/RESULT		
Consider available opportunities to provide stormwater runoff treatment outside of the Aurora Corridor footprint.		

Appendix A

Review options for a regional approach to stormwater runoff

The VE team reviewed 3 possible alternatives for a regional stormwater facility to address flow control and water quality. It should be noted that maintenance is increased with each option.

1. Use a portion of Boeing Creek for stormwater treatment -
This option does not require property purchase, but would require improvements made to the channel to provide both stormwater treatment and flow control. Costs associated with this option are estimated to be between \$400,000-600,000. This option may have limited opportunities to provide surface improvements due to space constraints. A net savings compared to the Filterra systems of approximately \$400,000-600,000 is possible.
2. Purchase a parcel near Boeing Creek to provide treatment opportunities -
Purchase of approximately ½ acre at current prices would be approximately \$1M, with an additional \$300,000-500,000 in improvements required. This option would likely increase cost in the range of \$300,000-500,000 to implement.
4. Explore a conventional treatment system within the corridor footprint -
An option such as an underground vault is a possibility, though it is contrary to the desires of the community to provide a natural stormwater collection/treatment system. This option could run between \$750,000-1,250,000.

The VE team recommends option 1 if the decision to provide a regional stormwater runoff collection/treatment facility is decided upon.

FUNCTION: Accommodate Runoff		IDEA # 5
TITLE: Use ecology embankments within the median		
BASELINE DESIGN ASSUMPTION		
Ecology embankments are not currently shown in median areas.		
PROPOSED ALTERNATIVE		
Include ecology embankments in median areas where applicable.		
DISCUSSION		
Ecology embankments within median areas are not proposed at this stage of design. Consider utilizing embankments in median areas to treat stormwater runoff from road surface where road geometry will allow.		
ADVANTAGES		DISADVANTAGES
<ul style="list-style-type: none"> • Reduces maintenance for treatment of stormwater runoff 	<ul style="list-style-type: none"> • Roadway geometry may not allow portions of roadway to flow to center 	
<ul style="list-style-type: none"> • Promotes desire to utilize natural stormwater treatment methods 	<ul style="list-style-type: none"> • 	
<ul style="list-style-type: none"> • 	<ul style="list-style-type: none"> • 	
<ul style="list-style-type: none"> • 	<ul style="list-style-type: none"> • 	
<ul style="list-style-type: none"> • 	<ul style="list-style-type: none"> • 	
RECOMMENDATION/RESULT		
Evaluate whether ecology embankments in center median areas are viable without significantly affecting roadway profile and cross-section geometry.		

2008058

DESIGN SUGGESTION

This page intentionally left blank.

FUNCTION: Accommodate Runoff		IDEA # 6	
TITLE: Bore through the glacial til strata to unsaturated outwash for infiltration			
BASELINE DESIGN ASSUMPTION			
Use of conventional and low impact development systems. Flow control is not required or provided.			
PROPOSED ALTERNATIVE			
Bore through the glacial til soil strata to reach the permeable and unsaturated recessional-outwash (Qva) layer and route stormwater flow into catch basins at drain chimneys.			
DISCUSSION			
A specific geotechnical exploration is required, with a pilot bore hole located in areas with the highest likelihood of reaching the recessional outwash layer below. We suggest locating near N 175th St along the Aurora corridor based on the NRCS soil maps. This is also a low point in the Boeing Creek basin on the project. In the event that the results prove positive, further exploration should be undertaken for design purposes. A similar system was designed by AES and used on a private development at Redmond Ridge for approximately 90 acres of development at Snoqualmie Ridge, and for the Puyallup School District.			
ADVANTAGES		DISADVANTAGES	
<ul style="list-style-type: none"> Eliminates or reduces the proposed conveyance system 		<ul style="list-style-type: none"> Cost of additional geotechnical exploration 	
<ul style="list-style-type: none"> Provides the desired flow control that would mitigate current flooding conditions 		<ul style="list-style-type: none"> Cost of drain chimneys connecting to outwash layer below 	
<ul style="list-style-type: none"> Serves as a supplemental water quality measure 		<ul style="list-style-type: none"> Potential impact to downstream flow of outwash 	
<ul style="list-style-type: none"> Preferred LID method of flow control 		<ul style="list-style-type: none"> 	
RECOMMENDATION/RESULT			
Implement if proven feasible.			
COST SUMMARY		Initial Cost	Subsequent Cost (Present Value)
Baseline Design Assumption		\$ 1,209,000	\$ -
Proposed Alternate		\$ 637,000	\$ -
Total (proposed less baseline)		\$ (572,000)	\$ -
			Net Present Value (Initial plus subsequent)
			\$ 1,209,000

IDEA # 6

TITLE: Bore through the glacial til strata to unsaturated outwash for infiltration

SKETCH OF BASELINE ASSUMPTION

Filterra

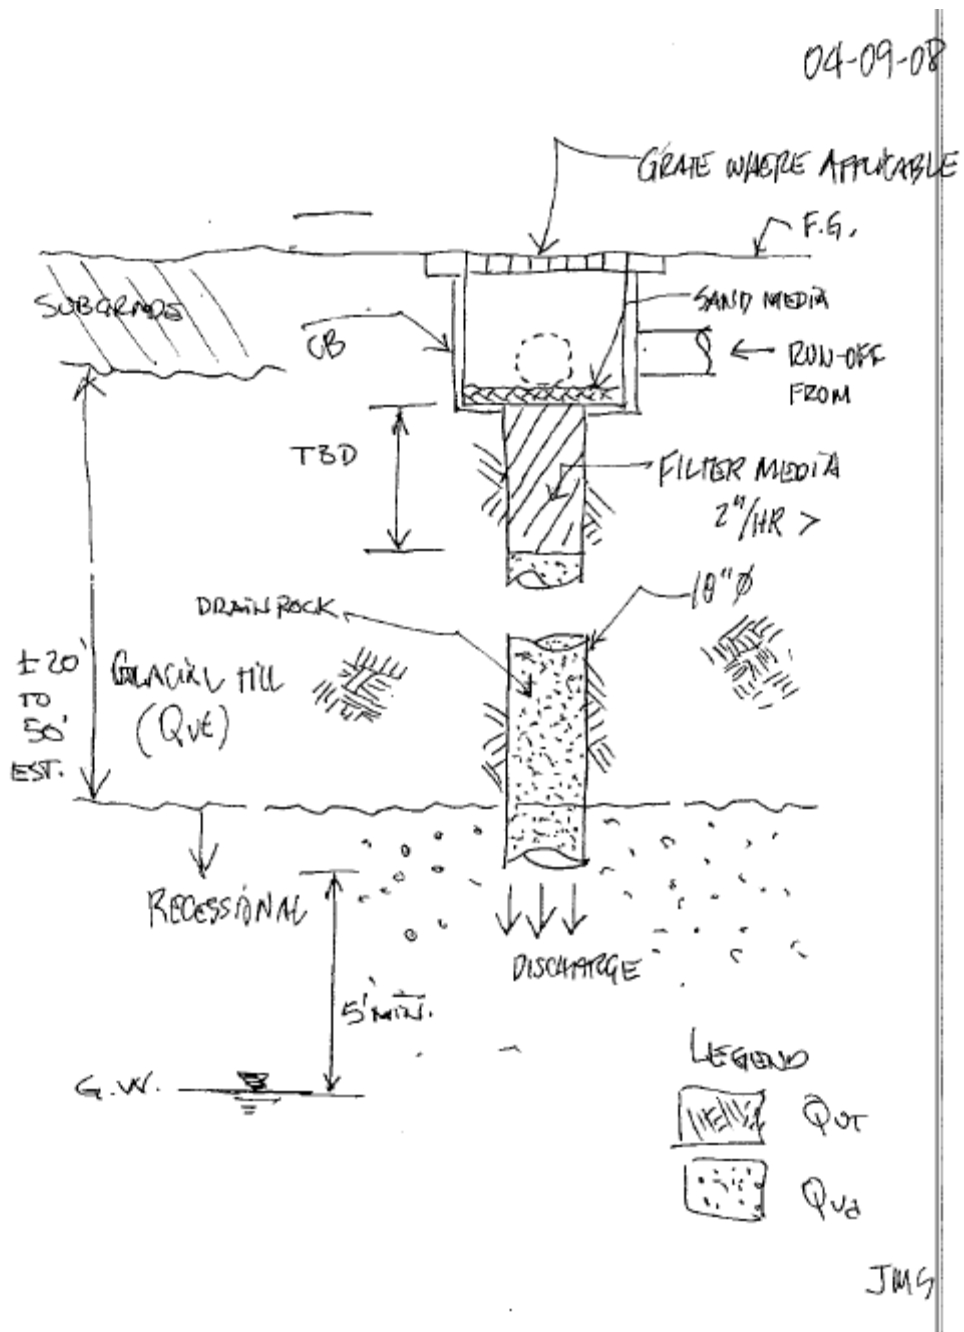

FUNCTION: Accommodate Runoff

IDEA # 6

TITLE: Bore through the glacial till strata to unsaturated outwash for infiltration

SKETCH OF PROPOSED ALTERNATIVE

FUNCTION: Accommodate Runoff		IDEA # 10
TITLE: Use Langeberg property for laydown/staging		
BASELINE DESIGN ASSUMPTION		
The entire Langeberg property at 185th & Aurora is to be purchased (that needed for the project and the uneconomic remnant). An existing purchase and sale agreement exists with property owner. The site is contaminated and the City's goal is to quantify contamination and negotiate with property owner by mid 2008. City is also considering the sale of the uneconomic remnant portion of parcel (approximately 2/3 of the parcel). Purchased property to be used for addition of free right turn lane and corner amenities including curb ramp and signal equipment.		
PROPOSED ALTERNATIVE		
Utilize entire site for laydown/staging area during construction. Utilize uneconomic remnant for natural stormwater system treatment area.		
DISCUSSION		
It is anticipated that the April 2008 testing and soil characterization will reveal onsite and ROW contamination. This assumption is based on prior onsite and ROW testing. It is anticipated this site and the ROW will be remediated prior to, or as part of, the Aurora Project. This site is on the north end of this segment of the Aurora Project, will be completely owned by the City, and could be a laydown/staging area to serve the north end of the project. The uneconomic remnant could be used by the City for a natural stormwater system treatment area.		
ADVANTAGES		DISADVANTAGES
<ul style="list-style-type: none"> Laydown = north end of project, not directly adjacent to a business, City owned, could sell property for profit after project if desired. 	<ul style="list-style-type: none"> Laydown = busy intersection, not very large parcel, needs to be cleaned up (how to phase?) 	
<ul style="list-style-type: none"> Stormwater treatment = will be City owned property, City gateway intersection, room to do rain garden, potential to partner with Sky Nursery, could be more effective than Filterra systems 	<ul style="list-style-type: none"> Stormwater treatment = top of watershed (maybe not a lot of water to drain here) 	
<ul style="list-style-type: none"> 	<ul style="list-style-type: none"> 	
<ul style="list-style-type: none"> 	<ul style="list-style-type: none"> 	
<ul style="list-style-type: none"> 	<ul style="list-style-type: none"> 	
RECOMMENDATION/RESULT		
Use as laydown/staging area during construction. Strategize site cleanup and project start/laydown area needs. As a natural stormwater system, evaluate opportunities to use this site for natural stormwater system installation, utilize natural stormwater system as educational opportunity, and beautify this intersection. Potential to team with Sky Nursery for development/maintenance of natural stormwater system vegetation.

DESIGN SUGGESTION

This page intentionally left blank.

FUNCTION: Improve Efficiency		IDEA # 11	
TITLE: Assign a utility coordinator			
BASELINE DESIGN ASSUMPTION			
The 30% plans and estimate do not deal with the assignment of a utility coordinator to the project during construction.			
PROPOSED ALTERNATIVE			
Propose that a utility coordinator be assigned to the project by the construction contractor as an integral part of the construction team.			
DISCUSSION			
Because of the large quantity of existing utilities on this project and because of the difficulty in organizing and scheduling the work of these utilities during construction, there is a high possibility that delays and claims may result from the interruption of the contractors' production and sequencing of the work. Having a coordinator on the project to specifically deal with the utilities help reduce the risk from this complicated issue. This position should be clearly spelled out in the specifications. Although at this time it will be necessary to add an item to the contract total amount that will increase the contract, our experience is that when an utility coordinator is assigned to the work, a savings will be made because delays and claims for utility claims will be greatly reduced or eliminated.			
ADVANTAGES		DISADVANTAGES	
<ul style="list-style-type: none"> Establishes one point of contact for coordination 		<ul style="list-style-type: none"> Utility coordinator may be difficult to find with experience 	
<ul style="list-style-type: none"> Creates a central clearing house for the utility companies and contractor 		<ul style="list-style-type: none"> Coordinator not trusted by utility companies 	
<ul style="list-style-type: none"> Addresses problems/scheduling issues upfront at coordination meetings 		<ul style="list-style-type: none"> 	
<ul style="list-style-type: none"> 		<ul style="list-style-type: none"> 	
RECOMMENDATION/RESULT			
It is recommended that a utility coordinator be assigned by the contractor and a pay item be established for activity.			
COST SUMMARY		Initial Cost	Subsequent Cost (Present Value)
Baseline Design Assumption	\$ -	\$ -	Net Present Value (Initial plus subsequent) \$ -
Proposed Alternate	\$ 20,000	\$ -	\$ 20,000

Note: Total Costs are rounded to nearest thousand dollars

FUNCTION: Improve Efficiency		IDEA # 12	
TITLE: Identify staging areas within project limits			
BASELINE DESIGN ASSUMPTION			
No staging areas have been identified on the 30% drawings.			
PROPOSED ALTERNATIVE			
Identify and secure temporary use of properties adjacent to the work zone with ideally an acre of area or more.			
DISCUSSION			
For a project of this magnitude, a minimum of one acre of property for staging and laydown during construction is ideal. This would minimize logistics for contractor during construction in lieu of an offsite location. Refer to proposed sketch for detail of possible sites.			
ADVANTAGES		DISADVANTAGES	
<ul style="list-style-type: none"> Facilitates operations during construction 		<ul style="list-style-type: none"> Requires early coordination and additional City and property owner negotiations for easement or purchase 	
<ul style="list-style-type: none"> Minimizes mobilization from and to an offsite lay-down and staging area 		<ul style="list-style-type: none"> Increases cost of temporary lease and or purchase of property 	
<ul style="list-style-type: none"> Reduces cost 		<ul style="list-style-type: none"> 	
<ul style="list-style-type: none"> Possible use as a permanent drainage mitigation facility if located downstream of basin 		<ul style="list-style-type: none"> 	
<ul style="list-style-type: none"> Increases safety and reduces risk from construction traffic 		<ul style="list-style-type: none"> 	
RECOMMENDATION/RESULT			
Implement and have available in contract documents

FUNCTION: Improve Efficiency	IDEA # 13
-------------------------------------	------------------

TITLE: Have contractors develop a traffic control plan

BASELINE DESIGN ASSUMPTION

Contract special provisions have not been developed as of this date. The assumption is the contractor will be required to utilize the standard plan (K plans) for traffic control. These plans cover normal lane closures, normal lane tapers, and standard signing and delineations.

PROPOSED ALTERNATIVE

Specify that contractor-prepared traffic control plans be all encompassing and include Metro bus locations, pedestrian travel routes, crosswalk locations, suggested speeds through the project, flagger locations, uniform police locations, etc.

DISCUSSION

On a project of this type (heavy traffic/high pedestrian counts, bus locations, many businesses, etc.), it is mandatory for the contractor to thoroughly plan their work and accommodate the public and businesses. In doing a thorough plan, safety is maximized, conflicts with pedestrians and business impacts reduced, and, if well thought out, efficiencies improved. If the traffic control plan is well thought out, there may be a potential to reduce time on the contract because the project can be constructed in a more uniform pattern. This plan will include, as a minimum, flagger positions, uniform police use, pedestrian movement and protection, bus shelter locations and time of use of this plan. It must be approved prior to use and implementation.

ADVANTAGES	DISADVANTAGES
<ul style="list-style-type: none"> Increases safety 	<ul style="list-style-type: none"> May be extra cost associated with details required by this special provision
<ul style="list-style-type: none"> Improves image 	<ul style="list-style-type: none"> Increases administration cost for reviewing plan
<ul style="list-style-type: none"> Improves efficiency 	<ul style="list-style-type: none">
<ul style="list-style-type: none"> Easier for project management (both owner and contractor) 	<ul style="list-style-type: none">

RECOMMENDATION/RESULT

It is recommended the contractor be required by specification to provide a traffic control plan for all major construction activities that impact the travelled roadway.

FUNCTION: Improve Efficiency		IDEA # 14
TITLE: Develop sequencing plan for the overall construction		
BASELINE DESIGN ASSUMPTION		
Standard WSDOT construction phasing plan is likely. No staging plans have been developed yet.		
PROPOSED ALTERNATIVE		
Prepare a more in depth proposed construction phasing plan that considers through traffic, frontage, community, utilities, and traffic control impacts		
DISCUSSION		
The design of the project should compliment the anticipated construction sequencing. Contractor input can be solicited at this stage of design and used to compliment input from the community and businesses regarding a potential execution strategy. This plan should be used as an aide in the design process to verify that all work anticipated within a given phase can be constructed without reliance on work from a future phase, and a greater number of potential impacts are identified and addressed. This information can be included in the contract documents with notes that should bidders desire to deviate from the proposed plan, they would be responsible for any interferences or issues resulting from the revised sequencing plan.		
ADVANTAGES		DISADVANTAGES
<ul style="list-style-type: none"> Reduces conflicts between utility systems (wet vs. dry) 		<ul style="list-style-type: none"> Requires extra coordination effort during design
<ul style="list-style-type: none"> Improves coordination between grading, paving, and underground utility installations 		<ul style="list-style-type: none">
<ul style="list-style-type: none"> Reduces frontage impacts 		<ul style="list-style-type: none">
<ul style="list-style-type: none"> Increases potential for shorter construction duration 		<ul style="list-style-type: none">
<ul style="list-style-type: none"> 		<ul style="list-style-type: none">
RECOMMENDATION/RESULT		
Recommend implementation of this idea.		

This page intentionally left blank.

FUNCTION: Improve Efficiency		IDEA # 15
TITLE: Use plastic zip barrier to improve delineation of access points		
BASELINE DESIGN ASSUMPTION		
Portable plastic barriers are currently not included in project to delineate driveway access points.		
PROPOSED ALTERNATIVE		
Add portable plastic or work zone barriers to clearly delineate driveway ingress locations.		
DISCUSSION		
During the first mile of construction, some drivers indicated that it was difficult to understand where to cross through orange traffic drums to access businesses and parcels. The City has been asked to better delineate access points during the next phase of construction. Barriers could alternate between orange and white to signify access point locations as opposed to orange drums along the extent of the work area. By providing better access point delineation coupled with wide driveway widths may help to increase the number of people wanting to frequent a business during the construction period.		
ADVANTAGES		DISADVANTAGES
<ul style="list-style-type: none"> Improves access point delineation leading to increased safety 		<ul style="list-style-type: none"> Increases project cost
•		•
•		•
•		•
•		•
RECOMMENDATION/RESULT		
Recommend exploring various options for implementing a portable plastic barrier system that better delineates driveway access points along construction work zone areas.		

2008058

DESIGN SUGGESTION

FUNCTION: Improve Efficiency **IDEA #** 15

TITLE: Use plastic zip barrier to improve delineation of access points

SKETCH OF PROPOSED ALTERNATIVE

FUNCTION: Improve Efficiency		IDEA # 16
TITLE: Add incentive clauses to contract documents		
BASELINE DESIGN ASSUMPTION		
Includes a standard time for completion specification with liquidated damages.		
PROPOSED ALTERNATIVE		
Include a detailed special provision in the project construction documents to include financial incentives to the contractor to complete construction in advance of project schedule.		
DISCUSSION		
Incentives are generally used on public projects that have significant impacts to users and the community. Allowing the contractor the option to work extended days (over 8 hour days) and weekends will be needed to compact the construction schedule. The contract should specify the incentive terms and amount, as well as a cap on the total incentive that can be earned. <small>As construction impacts business access and visibility, revenue, disrupts traffic flow, and has significant</small>		
ADVANTAGES		DISADVANTAGES
<ul style="list-style-type: none"> Reduces overall impacts on users 	<ul style="list-style-type: none"> Increases costs 	
<ul style="list-style-type: none"> Potentially reduces schedule 	<ul style="list-style-type: none"> Extended contractor hours increases construction management cost 	
<ul style="list-style-type: none"> motivates the contractor to expedite and take ownership of coordination among all parties, including utility franchises 	<ul style="list-style-type: none"> Increases noise potential 	
<ul style="list-style-type: none"> 	<ul style="list-style-type: none"> 	
<ul style="list-style-type: none"> 	<ul style="list-style-type: none"> 	
RECOMMENDATION/RESULT		
It is recommended the City and the design team review options in VE report that reduce impact on the public and choose the one that best fits this situation.		

2008058

DESIGN SUGGESTION

This page intentionally left blank.

FUNCTION: Improve Efficiency		IDEA # 17	
TITLE: Maximize daylight working hours			
BASELINE DESIGN ASSUMPTION			
Assume that baseline design did not look at scheduling working hours at this time.			
PROPOSED ALTERNATIVE			
A special provision should be written that addresses work hours within the traveled way and details work that may begin outside the traveling lanes. Provisions should allow work to be performed as long as contractors comply with noise and other regulations.			
DISCUSSION			
The opportunity of moving a project toward completion is an advantage to the contractor and the owner. If the contractor has few limitations on work areas, they will be able to utilize crews better, maintain better production, provide a better sequencing plan, and provide a project completion quicker than anticipated in the design documents. Improved efficiencies should also reduce bid prices. Projected savings are avoided cost impacts to the community and not direct project savings.			
ADVANTAGES		DISADVANTAGES	
<ul style="list-style-type: none"> Reduced impacts 		<ul style="list-style-type: none"> Charging of work days may be questionable 	
<ul style="list-style-type: none"> Improved schedule 		<ul style="list-style-type: none"> Pedestrian and bus traffic may be disrupted 	
<ul style="list-style-type: none"> More time available for more tedious work- sidewalk grading, lane widening 		<ul style="list-style-type: none"> 	
<ul style="list-style-type: none"> 		<ul style="list-style-type: none"> 	
<ul style="list-style-type: none"> 		<ul style="list-style-type: none"> 	
RECOMMENDATION/RESULT			
Recommend that a study be made allowing contractor to work as many daylight hours as possible. Prepare Special Provisions that address work hours and allow maximum use of daylight hours.			
COST SUMMARY		Initial Cost	Subsequent Cost (Present Value)
Baseline Design Assumption		\$ 450,000	\$ -
Proposed Alternate		\$ -	\$ -

TOTAL (PROPOSED less BASELINE)								-450,000
								SAVINGS

Note: Total Costs are rounded to nearest thousand dollars

FUNCTION: Improve Efficiency		IDEA # 21, 20
TITLE: Hold specialized meetings for key stakeholders		
BASELINE DESIGN ASSUMPTION		
Stakeholder identification is being reviewed in the baseline design because of the responsibilities of the City and designer to address the concerns and issues.		
PROPOSED ALTERNATIVE		
Program meetings with key stakeholders such as franchise utilities and business owners, during construction. These meetings help the contractor/owner bring the construction project to the stakeholders in real time.		
DISCUSSION		
These meetings with stakeholders show commitment by the City to follow through on what was discussed during design. This provides a venue to discuss and address potential delays and issues from construction activities. This also helps put a face on the contractor and provides a comfort level for stakeholders.		
ADVANTAGES		DISADVANTAGES
<ul style="list-style-type: none"> • Improves communication 	<ul style="list-style-type: none"> • Increases number of meetings 	
<ul style="list-style-type: none"> • Improves credibility 	<ul style="list-style-type: none"> • Potentially requires more coordination 	
<ul style="list-style-type: none"> • Minimizes surprises 	<ul style="list-style-type: none"> • 	
<ul style="list-style-type: none"> • Demonstrates proactive approach 	<ul style="list-style-type: none"> • 	
<ul style="list-style-type: none"> • 	<ul style="list-style-type: none"> • 	
RECOMMENDATION/RESULT		
Recommend drafting a specification to require these meetings at regular intervals with key stakeholders.		

2008058

DESIGN SUGGESTION

This page intentionally left blank.

FUNCTION: Improve Efficiency		IDEA # 22
TITLE: Put enforcement provisions into agreements with utility franchisees		
BASELINE DESIGN ASSUMPTION		
City has franchise agreements with Seattle City Light, Seattle Public Utilities and Ronald Wastewater. No franchise agreements exist with telecommunication companies (Qwest, Verizon, T-Mobile) or the Shoreline School District. The franchise agreements do not necessarily address construction well. Separate agreements will be put together with each utility for construction of the project.		
PROPOSED ALTERNATIVE		
The school district claims they have no resources to participate in handling of their infrastructure in the project vicinity. A separate agreement should be put together with the school district to discuss financing and work completion of any school district infrastructure relocation.		
DISCUSSION		
The City needs to create an agreement with the school district. If the City decides to pay for the School District's infrastructure relocation (or rent them conduit that exists in the middle or Aurora), it needs to be an agreement.		
ADVANTAGES		DISADVANTAGES
<ul style="list-style-type: none"> Coordinated construction, certainty of who will pay 		<ul style="list-style-type: none"> City may choose to negotiate to pay
•		•
•		•
•		•
•		•
RECOMMENDATION/RESULT		
Draft agreements between the City and Shoreline School District to specifically address how relocation of overhead communications infrastructure will be paid for.		

2008058

DESIGN SUGGESTION

This page intentionally left blank.

FUNCTION: Improve Efficiency		IDEA # 25
TITLE: Calculate traffic control costs from phase 1 and the anticipated construction sequence		
BASELINE DESIGN ASSUMPTION		
The estimate for the 30% plans has \$1.3M included for traffic control. This is essentially the amount spent on traffic control in phase 1.		
PROPOSED ALTERNATIVE		
Coordinate the anticipated bid item amounts for traffic control with the final construction sequencing plan and schedule. Specify that the line item charge for traffic control labor be paid by the hour.		
DISCUSSION		
This will match the traffic control costs with the construction schedule and construction sequencing plan anticipated during construction. As traffic control is related to safety, paying by the hour provides the City with the flexibility to make changes as required.		
ADVANTAGES		DISADVANTAGES
<ul style="list-style-type: none"> • More accurate estimate of costs 		<ul style="list-style-type: none"> • Higher level of effort required
<ul style="list-style-type: none"> • Better planning 		<ul style="list-style-type: none"> •
<ul style="list-style-type: none"> • 		<ul style="list-style-type: none"> •
<ul style="list-style-type: none"> • 		<ul style="list-style-type: none"> •
<ul style="list-style-type: none"> • 		<ul style="list-style-type: none"> •
RECOMMENDATION/RESULT		
Coordinate the anticipated bid item amounts for traffic control with the final construction sequencing plan and schedule.		

2008058

DESIGN SUGGESTION

This page intentionally left blank.

FUNCTION: Improve Efficiency		IDEA # 26
TITLE: Provide utility stubs (both dry and wet) for future development		
BASELINE DESIGN ASSUMPTION		
No provisions have been made for additional utility stubs.		
PROPOSED ALTERNATIVE		
In coordination with SPU and Ronald Wastewater District, establish a plan for future services to parcels fronting the roadway improvements. In addition, upgrade existing service connections and install new stub-outs to parcels not yet developed or identified for re-development.		
DISCUSSION		
After the final paving lift over Aurora was completed in Phase 1, SPU came in with water service connections and had to patch the new pavement. This idea would prevent this from happening in phase 2 after the final pavement lift in the proposed roadway improvements.		
ADVANTAGES		DISADVANTAGES
<ul style="list-style-type: none"> • Reduces patching new pavement surface 	<ul style="list-style-type: none"> • Requires additional coordination and tracking 	
<ul style="list-style-type: none"> • Maintains aesthetics 	<ul style="list-style-type: none"> • Requires projecting of future development 	
<ul style="list-style-type: none"> • Improves public perception of City work 	<ul style="list-style-type: none"> • Requires setting up late-comer agreements 	
<ul style="list-style-type: none"> • 	<ul style="list-style-type: none"> • 	
<ul style="list-style-type: none"> • 	<ul style="list-style-type: none"> • 	
RECOMMENDATION/RESULT		
Implement this idea.		

2008058

DESIGN SUGGESTION

This page intentionally left blank.

FUNCTION: Improve Efficiency		IDEA # 33	
TITLE: Identify work that must be performed at night			
BASELINE DESIGN ASSUMPTION			
The 30% plans do not address work hours.			
PROPOSED ALTERNATIVE			
Specify project areas where only night work is allowed.			
DISCUSSION			
The contractor, knowing this, may be able to get their suppliers and subcontractors to provide better pricing because their operations during the day would not be impacted by this project. Savings may be realized in the production areas due to better travel times and more trips. At times, working at night increases production because of less distractions to the employees. These locations would need to be coordinated with the construction sequencing plan and design development.			
ADVANTAGES		DISADVANTAGES	
<ul style="list-style-type: none"> Increased resources 		<ul style="list-style-type: none"> Increases cost premium for night work 	
<ul style="list-style-type: none"> Improves travel time 		<ul style="list-style-type: none"> Increases noise impact at night 	
<ul style="list-style-type: none"> Increases productivity 		<ul style="list-style-type: none"> 	
<ul style="list-style-type: none"> Reduces community impact 		<ul style="list-style-type: none"> 	
<ul style="list-style-type: none"> 		<ul style="list-style-type: none"> 	
RECOMMENDATION/RESULT			
Recommend incorporating a special provision into the contract to designate night work areas.			
COST SUMMARY			
	Initial Cost	Subsequent Cost (Present Value)	Net Present Value (Initial plus subsequent)

FUNCTION: Improve Safety		IDEA # 35
TITLE: Increase temporary illumination; provide a bid item for this work		
BASELINE DESIGN ASSUMPTION		
Temporary illumination during construction activity is currently not included in design or as a bid item shown in the cost estimate. During certain times of the year the roadway corridor will be darkened to less than desirable illumination levels.		
PROPOSED ALTERNATIVE		
Provide bid item for temporary illumination and provide special provision in the specifications outlining what will be required by the contractor for temporary illumination during construction.		
DISCUSSION		
During the first mile of construction of the Aurora Corridor project, there were periods when the illumination levels were significantly decreased due to a variety of reasons. Concerns have been expressed about the lack of available lighting at times and a desire to increase the visibility of the roadway and construction interface. Providing illumination during the lighting switch-overs or during dark working hours will improve safety.		
ADVANTAGES		DISADVANTAGES
<ul style="list-style-type: none"> Increases visibility of roadway and construction zone 		<ul style="list-style-type: none"> Add cost and scheduling considerations to project
<ul style="list-style-type: none"> Improves safety 		<ul style="list-style-type: none">

<ul style="list-style-type: none"> 		<ul style="list-style-type: none">
<ul style="list-style-type: none"> 		<ul style="list-style-type: none">
RECOMMENDATION/RESULT		
Recommend adding a bid item and special provision outlining the level of temporary illumination to be required.		

2008058

DESIGN SUGGESTION

This page intentionally left blank.

FUNCTION: Improve Safety		IDEA # 42	
TITLE: Identify a traffic control supervisor in the contract documents			
BASELINE DESIGN ASSUMPTION			
30% documents have no special provisions. No line item seen in contract 30% estimate.			
PROPOSED ALTERNATIVE			
Add an item in the contract, "Traffic Control Supervisor", in Section 1-02.2 Traffic Control Management and Section 1-02.2(1) General.			
DISCUSSION			
This item provides a responsible person from the contractor's staff that is exclusively responsible for planning, conducting and performing the work safely. This person prepares traffic control plans that will include pedestrian path ways/crosswalks and Metro bus locations. The plans can also include driveways protection and delineation methods for driveways. Include flagger and uniform police locations during the work effort.			
ADVANTAGES		DISADVANTAGES	
<ul style="list-style-type: none"> Provides advance notice on traffic control for a variety of work efforts 		<ul style="list-style-type: none"> Requires additional contract provision 	
<ul style="list-style-type: none"> Identifies point of contact for the contractor 		<ul style="list-style-type: none"> 	
<ul style="list-style-type: none"> Establishes emergency phone numbers and responsible person in charge 		<ul style="list-style-type: none"> 	
<ul style="list-style-type: none"> 		<ul style="list-style-type: none"> 	
<ul style="list-style-type: none"> 		<ul style="list-style-type: none">

Recommend that design team explore alternative approaches to traffic control than previously employed methods during first mile.		

2008058

DESIGN SUGGESTION

This page intentionally left blank.

FUNCTION: Improve Safety		IDEA # 45
TITLE: Review locations where hand rails should be installed		
BASELINE DESIGN ASSUMPTION		
Curbing and handrails will be used to provide safety at back of walk.		
PROPOSED ALTERNATIVE		
Review locations where it makes sense to provide curbing vs. handrails to meet safety requirements.		
DISCUSSION		
Certain back of walk locations along the first mile did not require handrails since the vertical drop was less than 30", which is the maximum height difference allowed without installing a handrail. Some vertical drops at certain areas such as intersections could still be problematic, especially for special needs users.		
ADVANTAGES		DISADVANTAGES
<ul style="list-style-type: none"> Improved safety 		<ul style="list-style-type: none"> Added cost
•		•
•		•
•		•
•		•
RECOMMENDATION/RESULT		
Review all back of walk locations to see if handrails are still worth considering for drops less than 30" or if it is reasonable to install curbing to help maintain and keep pedestrian traffic on sidewalk areas and improve safety at back of walk locations. Verify that rails are being install in a consistent manner.

FUNCTION: Miscellaneous		IDEA # 50
TITLE: Utilize an A+B bidding concept to allow the City to select the optimum relationship between cost and schedule		
BASELINE DESIGN ASSUMPTION		
The 30% plan set has not set a duration for the contract work.		
PROPOSED ALTERNATIVE		
Use the A+ B method to contract the work.		
DISCUSSION		
The A+B method is a means to reward a contractor for completing the project as quickly as possible. By providing a cost for each working day, the contract combines the cost to perform the work (A component) with the cost of the impact to the public (B component) to provide the lowest cost to the public. Under the A+ B method of contracting, the Owner contractually recognizes there is a monetary value for each working day that can be eliminated from the contract. Further, a contractor who can work faster, at a higher cost may provide the best value to the public. A recommended number of working days can be identified in the project documents. See attached for an explanation of the process.		
ADVANTAGES		DISADVANTAGES
<ul style="list-style-type: none"> Provides best value for the public 	<ul style="list-style-type: none"> Delays outside the owner's control may impact the contractor's schedule and void the incentive pay and reduction of time 	
<ul style="list-style-type: none"> Allows job to vary from the traditional low bid procedure and still remain competitive 	<ul style="list-style-type: none"> Increases original contract estimate 	
<ul style="list-style-type: none"> Allows alternate solutions that may take sufficiently less time but can not be specified as a proprietary solution 	<ul style="list-style-type: none"> Introduces items outside the contractor's control that may impact schedule 	
<ul style="list-style-type: none"> Utilizes innovative solutions by specialty contractors that go beyond the designers' expertise 	<ul style="list-style-type: none"> 	
<ul style="list-style-type: none"> 	<ul style="list-style-type: none"> 	
RECOMMENDATION/RESULT		
Study A + B Method for inclusion in special provisions. Estimated savings to the traveling public could approach \$2M in time and resources.

DESIGN SUGGESTION

Alternative Project Delivery

A+B Bidding

[Introduction](#)

[Project Selection](#)

[Pre-Bid Procedures](#)

[Background Information](#)

A+B bidding is a method of rewarding a contractor for completing a project as quickly as possible. By providing a cost for each working day, the contract combines the cost to perform the work (A component) with the cost of the impact to the public (B component) to provide the lowest cost to the public.

A+B bidding is a cost-plus-time bidding procedure. The low bidder is selected based on a combination of the traditional contract unit price items based bid (A) and the time component proposed by the bidder to complete the project or a critical portion of the project (B). The time to complete the project (B) is assigned a monetary value and combined with the contract items based bid (A) to select the contractor. The bidder with the lowest overall combined bid (A+B) is awarded the contract. In the actual contract, the contractor will only be reimbursed for unit items (A). The time allowed to complete the project is set at the bidders time component (B).

Contractor	Bid Amount	No. Days	Road User Cost	Combined
A	\$4,300,000	130	\$12,000	\$5,860,000
B	\$4,900,000	110	\$12,000	\$6,220,000
C	\$4,450,000	115	\$12,000	\$5,830,000

Combined
Low

In the example above, Contractor C had the lowest combined total. A contract of \$4,450,000 would be awarded to Contractor C with 115 working days. WSDOT is willing to pay a higher premium to Contractor C for a lower overall public impact.

On certain projects there may be a faster way to perform the work that has a slightly higher cost increment. Under the traditional bidding mechanisms, the contractor cannot plan to use this method during the bid procedures and remain competitive.

Under the A+B method of contracting, WSDOT contractually recognizes that there is a monetary value for each working day that can be eliminated from the contract. Further, a contractor who can work faster, at a higher cost, may provide the best value to the public.

A+B bidding should not be used on all contracts. When the allowable traffic restrictions are such that there is only one way to perform the project, WSDOT designers should simply state the allowable contract time. Examples of projects that could be considered for A+B bidding include:

- Widening projects where permanent traffic control is to be set up for an extended period of time.
- Projects which have multiple activities occurring which don't necessarily have to be done

sequentially.

- Projects where the contractors presence/activities will impact traffic regardless of whether traffic control is set up.
- Projects which allow alternate solutions where one solution may take significantly less time to construct but designers are hesitant to specify a proprietary solution.
- Projects in which innovative solutions by the contractor are sought (specialty work) which may be beyond WSDOT designer's expertise.

Incentive/disincentive (I/D) provisions may also be used to ensure early completion and discourage unbalanced bidding.

Project Selection Criteria for A + B Bidding

[↑ top](#)

The following is a list of potential criteria that should be considered prior to a designer choosing an A+B selection mechanism for a project.

- Traffic restrictions, lane closures, or detours are likely to result in significant user costs. The contractual incentive of the "B" component cannot be readily apparent if the value is too low. On lower volume roads, with acceptable detours, user impacts are not likely to be high enough to justify selecting a higher priced project.
- Significant impacts to the local community or economy during construction warrant expediting the total length of the project. Some projects, despite their location on lower volume roadways, will have significant impacts on the local economy. In these cases a designer may decide that the potential to minimize the economic impacts justify the additional cost of acceleration.
- Traffic control staging, using specialized equipment or methods, can be structured to maximize a contractor's ability to reduce the time for completion at a reasonable increase in cost. This potential staging should be one that designers are hesitant to specify as it may reduce competition. For example, one competitor has an established plant adjacent to the project which could make access to the workzone more efficient and thereby potentially shorten the work window. Specifying the use of a sole-source in this instance would likely not provide a competitive price.
- The project is relatively free of utility conflicts, design uncertainties, right-of-way conflicts, or other issues, that may impact the award date or critical project scheduling, but remain outside of the contractor's control. Items that are outside of the contractors control but may impact the overall project delivery could make it exceedingly risky for a contractor to guarantee an early delivery.
- WSDOT seeks contractor expertise to facilitate an early completion. In some cases expertise within the contracting community may be able to provide a more efficient solution to a problem. Specialized work and mechanical/electrical projects could potentially fall within this category.

[↑ top](#)

Pre-Bid Procedures

Prior to bidding, WSDOT designers should investigate the feasibility of proposed construction procedures and identify any workable alternative approaches. Consider outreach to the contracting community, particularly when potential specialty work is being contemplated.

Identify potential third party (railroad, utilities, etc.) issues and take steps to mitigate any conflicts.

Involvement and buy-in of the Project Construction Office is critical to the success of this process. Any potential time risks should be within the control of the contractor. Involve the Construction Project Engineer in any decision regarding contract time.

When specifying A+B bidding WSDOT designers should avoid the temptation to reduce the maximum allowable time component down to impossibly low threshold. It should be recognized that, by putting a value on time, the best value bid might provide a lower unit price but require additional time.

In order to maintain a level playing field for bidders, open meetings to all interested bidders. One way of doing this is to make an announcement in the weekly Notice to Contractors at least three weeks prior to the meeting. Contact Pre-Contract Administration in WSDOT Headquarters at (360) 705.7017. Items to be considered and discussed include:

- Feasibility - The use of A + B bidding will allow WSDOT to realize the defined project goals effectively and within desired time constraints at an acceptable cost.
- Alternative Approaches - Determine if alternative approaches can be used in the project. If only one approach is determined to be feasible, require it in the contract.
- Third Party Conflict Resolution - The details of potential third party conflicts involving utilities, railroad agreements, environmental/archaeological issues, hazardous materials, public support issues, and other potential projects are addressed in a constructability review, and a plan worked out to mitigate the development of such conflicts.
- Assessment of Risk - Before a decision is made, the construction project office should carefully review the PS&E to determine that there will be few, if any, changes in the contract. If a contract has a large number of change orders, it is likely that any premiums paid by WSDOT to the contractor will be lost through contract negotiations on changes.

Background Information

Consideration for A+B Bidding

The considerations needed to determine if the project lends itself to A+B Bidding is the risk in using this type of tool is associated with changes and delays beyond the contractor's control. Contract time will have to be a consideration with regard to every change order. One way to reduce the chance of problems is to sort out the details of potential third party conflicts involving utilities, railroad agreements, environmental/archaeological issues, hazardous materials, biohazards, public support issues, and other potential problems. Address and mitigate these prior to construction.

Consider whether a contractor can accurately predict the durations of all activities for the project at the time of bid. Larger, more complex projects may not be appropriate.

A+B bidding potential for increase cost.

Potentially, A+B contracts can increase the construction cost. On a standard project, a contractor may see an opportunity to reduce the total impacts. A shorter duration solution may increase the primary item cost, but the reduction in impacts would reduce the overall traffic control cost. As the contractor does not share in the savings on traffic control, they are not likely to bid the shorter duration solution.

Designers should anticipate that there will be a cost for the reduction in days. Whether through acceleration, aggressive management of subcontractors, or specialty equipment, it is likely that the construction price will increase. In no case will the project cost increase greater than the incentive (road user benefit) being offered.

WSDOT construction engineering/inspection costs should be reduced due to the anticipated increase

in multiple activities occurring at the same time coupled with the reduced amount of traffic control being used.

[↑ top](#)

Safety Impact

Safety cannot be allowed to be impacted. Enforcement of the approved Work Zone Traffic Control Plans will remain with the Project Office.

Number of days for contractor

The contractor may be given a minimum number of days. The maximum amount of road user benefit costs would be provided in the special provision.

Change orders (added and deleted work) can effect A+B contracts

Change Orders will have to address lane rental individually. If a change requires additional traffic impacts, the amount specified in the contract will have to be modified as well.

How Credit is used with A+B contracts

The A+B specification identified time units in terms of working days. These working days, are established in the contractor's initial bid. The lowest combination of the construction cost combined with the time units required establishes the winning bid.

Once the contract is awarded time credits are tracked much like working days. Should a contractor go over the amount bid, the working days will continue to be charged. The unit item "Working Days - Additional" is included in the contract and entries made based upon an established value. These units are deducted as a standard item.

Alternative Project Delivery

Lane Rental

[Introduction](#)

[Approval for Use](#)

[How it Works](#)

[Special Provisions](#)

[Background Information](#)

[Lane Rental Considerations](#)

Lane Rental is used to minimize the impacts of a project on the traveling public. It is a method of transferring the roadway user costs to the contractor. The contractor must rent a lane in order to close it. This creates a monetary incentive for the contractor to be innovative and minimize the duration of lane closures.

The contractor makes decisions that consider the roadway user costs, both during the bid and as the contract progresses. The contractor's bid consists of a combination of the cost to perform the work (A component) with the cost of the impact to the public (B component) to provide the lowest cost to the public. By providing a more aggressive scheduling package, a contractor may be able to gain a competitive advantage by decreasing the overall impact to the traveling public and thereby reducing the amount for bid consideration.

Design Phase

During the design phase, the public impacts of the project are evaluated. The appropriate lane rental units and charges are determined. Lane rental time credit units will vary in size (minutes, hours, days) depending on the road user impacts, and will be as defined in the special provisions. For example, any section of one lane for any part of a working day is equal to one unit.

Bid Process

During the bidding process, the contractor determines the number of lane closures that will be required to complete the work. This number is included in the bid proposal.

After bids are opened, the contractor's lane rental bid is combined with the price proposal. The project is awarded to the contractor with the lowest adjusted bid. The number of "free" lane rental units in the contract is modified to reflect the awarded contractor's bid.

A lane rental closure is applied anytime a lane is closed, for any reason, to progress contract work. The project office tracks lane rentals.

Should the contractor go over the allotted amount, all additional lane rentals will be charged to "Lane Rental - Additional."

If a contract progresses into liquidated damages, the project office continues to track lane rentals but

does not charge them.

Approval for Use

The State Construction Engineer has conditionally approved lane rental on a pilot basis. The use of lane rental requires the approval of the [State Specifications Engineer](#) for the following reasons:

- To assist in establishing an appropriate unit and value for the closure.
- To concur that the application is appropriate. Commitments regarding application and notification have been made to industry, and we want to give this tool a fair chance to be successful.
- Headquarters Construction needs to be aware of where lane rental is being used in order to monitor the effectiveness of the specification and provide lessons learned throughout the state.

How Lane Rental Works

The contract is awarded based on the lowest responsible bid, using the following formula:

The bid amount for evaluation = A+ (B x LRC)

- A Bidder's total estimate for all contract bid items (expressed in dollars).
- B Total number of days subject to lane closure, as defined previously, required to complete all contract work.
- LRC Lane rental cost. These costs can be variable and applied to one or more lanes during a construction project.

This formula is used as a measurement for awarding purposes only, and is not used to determine payment to the contractor. The low bidder may not be the successful bidder. A bidder who proposes to minimize user impacts realizes the value of that benefit as part of their bid. They also run the greatest risk for damages (overrun of lane rental time credits).

Once the contract is awarded, the number of lane rental closures is contractually set. The item "Lane Rental - Additional" is included in the contract to address any overruns in this item. An incentive provision is also included to reward the contractor if the work is completed earlier than the (B) portion bid.

Special Provisions/GSP

When using the Flexible Start Date provision several options may be considered, depending on the desired outcome.

Section 1-02.6, Preparation of Proposal

Supplement with the following:

A lane rental fee is included as part of this contract. The bidder shall establish the number of lanes necessary to complete the work by

utilizing lane closures in accordance with the Plans and these Specifications and include this number in the bid proposal.

Definition of
(***\$1\$***)

A Lane Rental Credit shall be assessed for

The number of lane rental credits allowed shall not exceed (***\$2\$***) of lane closures and shall not be less than ***\$2\$*** of lane closure.

The product of the number of lane rental credits established by the bidder multiplied by the Lane Rental Cost shall be added to the bid total determined from all other bid items. The sum of these two amounts will be the amount used for comparison of bids to determine the lowest bid for award purposes. If a bidder fails to establish the number of lane rental credits, or if the bidder enters a number of lane rental credits not within the range specified above, the maximum credits shown above will be used for calculations to determine the lowest bid for award purposes. The product of lane rental credits times daily road user benefit costs will not be considered in determining payment to the contractor except as described in this special provision.

Note to designer: Requires an additional proposal page supplied through Pre-Contract Administration (similar to A+B bidding specification). Also requires the daily roadway user benefit to be entered on that additional proposal page.

Section 1-02.7, Amount of Bid Deposit:

Supplement with the following:

It will not be necessary for the bid deposit to include an amount to cover the product of lane rental credits of traffic control times daily road user benefit cost

Section 1-03.1, Consideration of Bids:

Supplement with the following:

Each bid submitted shall consist of two parts:

A = The dollar amount for all work to be performed under the contract

B = The total number of lane rental credits required to complete the work.

The lowest responsible bid will then be determined by the Contracting Agency as the lowest combination of (A) and (B) according to the following formula:

$$A + (B \times \text{Lane Rental Cost})$$

It is mutually agreed by the parties to the contract that ***\$3\$*** per lane rental credit of traffic impact is the stipulated adjustment for road user benefit costs. The preceding formula will only be used to determine the lowest responsible bidder and will not be used to determine final payment to the Contractor when the project is completed other than as described in this special provision.

Section 1-03.4. Contract Bond:

Supplement with the following:

It will not be necessary for the contract bond to include an amount to cover the product of lane rental credits of traffic impact times hourly road user benefit cost.

Measurement

In the event that the contractor exceeds the number of lane rental credits established in the bid the Engineer shall take a credit under the unit item "Additional Lane Rental Credits." Upon physical completion, the contractor will be paid for an under-run in lane rental credits under the item "Additional Lane Rental Credits."

Payment

Credits and Payments will be made per unit as described elsewhere in this special provision.

Background Information

What considerations need to be made to determine if the project lends itself to lane rental?

The risk in using this type of tool is associated with changes and delays beyond the contractor's control. Changes in lane rental costs will have to be considered with regard to change orders. One way to reduce the chance of problems is to sort out the details of potential third party conflicts prior to construction, to the extent it is possible. These conflicts may involve utilities, railroad agreements, environmental/archaeological issues, hazardous materials, biohazards, public support issues, and other potential problems.

Consideration should also be given to whether a contractor, at the time of bid, can accurately predict the duration of all activities for the project. Larger, more complex projects may not be appropriate for lane rental.

Construction Cost with Lane Rental

Lane rental can increase construction cost. On a standard project, a contractor may see an opportunity to reduce the total impacts. A shorter duration solution may increase the primary item cost but reduce lane rental and overall traffic control costs. The contractor will try to determine the most advantageous bid while balancing the potential overrun in lane rental costs.

Designers should anticipate that there will be a cost for the reduction in days. Whether through acceleration, aggressive management of subcontractors, or specialty equipment, it is likely that the construction price will increase. In no case will the project cost increase greater than the incentive (road user benefit) being offered.

WSDOT construction engineering and inspection costs should be reduced due to the anticipated increase in multiple activities occurring concurrently coupled with the reduced amount of traffic control being used.

Safety Issues

Copyright WSDOT © 2008

Safety shall not be compromised. The contractor is required to comply with the approved Work Zone Traffic Control Plans along with other related contract requirements.

Number of Lane Rentals

A special provision allows for a maximum number of lane rentals to be specified. Doing so can provide an upper limit of the public impact allowed on the project. However, the purpose of a lane rental charge is ultimately to produce the best value product. If a contractor can provide a far cheaper bid with more public impacts, this may be the best solution. The challenge is to set the lane rental charge at an appropriate level.

Lane Rental Charges and Liquidated Damages

Section 1-08.9 states that liquidated damages are for delays that inconvenience the traveling public, obstruct traffic, interfere with and delay commerce, and increase risks to highway users. For that loss of lane use, WSDOT charges liquidated damages. We do not charge the contractor for lane closures during this time frame, it would be a duplication of the liquidated damages.

Change orders (added and deleted work)

Change orders need to adjust lane rental days as they would any other contract item that is impacted by the change. Projects that have a likelihood of a large number of changes may not be good candidates for lane rental.

Pricing Lane Rental by Time of Day

The lane rental may be broken out by time of day. We can also break out the number of lanes closed at a location.

Time Credits

The lane rental specification identified time in terms of units. These units, once defined, are established in the contractor's initial bid. The lowest combination of the construction cost combined with the time units required would establish the winning bid.

Once the contract is awarded, time credits will be tracked much like working days. Should a contractor go over the bid amount, the credits will continue to be charged. The unit item "Lane Rental Units - Additional" should be included in the contract and entries made based upon an established value. These units are deducted as a standard item.

Overrun of Lane Rental Days

Traffic control items are generally reimbursed as unit items. The intention of lane rental is not to punish, but rather to reward a contractor for sound management and appropriate risk taking.

Lane Rental Considerations

Consider these factors when selecting lane rental for a project:

- Traffic restrictions or lane closures with no (or limited) alternate routes result in a high user cost.
- The project is relatively free of third party conflicts that are outside the control of the contract (right of way...

utility, environmental, etc.).

- There is a high degree of confidence that design uncertainties have been addressed in the plans.
- A reasonable contractor can accurately schedule (and bid) the amount of necessary lane closures to complete the work as described.
- "Closures" can be well defined.
- Opportunities exist to reduce closure times.
- User fees are substantial enough to offset the cost of the effort to reduce the closure time.

FUNCTION: Miscellaneous	IDEA # 60
--------------------------------	------------------

TITLE: Utilize the contractor's perspective in the constructability review process

BASELINE DESIGN ASSUMPTION

Construction management staff (KBA) will provide constructability review.

PROPOSED ALTERNATIVE

Hire contractor or someone with similar experience to review plans/specs for constructability.

DISCUSSION

The VE group believes a contractor or person who has been responsible for construction can provide a valuable plan/spec review. That is superior to a constructability/bidability review prepared by a resident engineer or inspector. A contractor can better provide work sequencing/efficiency feedback. A review of the intent of various specifications and pay items would be part of this review.

ADVANTAGES	DISADVANTAGES
-------------------	----------------------

<ul style="list-style-type: none"> • Adds a different perspective on constructability, pay items, and efficiency 	<ul style="list-style-type: none"> • Adds cost of additional review
<ul style="list-style-type: none"> • Identified logistical issues 	<ul style="list-style-type: none"> •
<ul style="list-style-type: none"> • 	<ul style="list-style-type: none"> •
<ul style="list-style-type: none"> • 	<ul style="list-style-type: none"> •
<ul style="list-style-type: none"> • 	<ul style="list-style-type: none"> •

RECOMMENDATION/RESULT

Engage a qualified, independent third party to review plans and specifications.

COST SUMMARY	Initial Cost	Subsequent Cost (Present Value)	Net Present Value (Initial plus subsequent)
Baseline Design Assumption	\$ -	\$ -	\$ -

FUNCTION: Miscellaneous		IDEA # 65
TITLE: Coordinate with Shoreline School District on communication infrastructure needs and plans		
BASELINE DESIGN ASSUMPTION		
Shoreline School District will pay for undergrounding of their communication fiber the entire length of the project. The School District has no franchise agreement with the City.		
PROPOSED ALTERNATIVE		
The Aurora Project budget does not include significant costs for School District communication infrastructure.		
DISCUSSION		
The School District has said they have no funds and cannot pay for undergrounding of their fiber. Consider whether franchise agreement is appropriate for school district. Consider funding their undergrounding (maybe put them in the City owned Global Crossing conduit in the middle of Aurora and charging them rent). Any benefit the City provides could be returned in "in kind services" from the School District. Coordinate with the School District to see if 1) City can use same fiber District has on poles, 2) District can pay for their infrastructure to go underground (or provide an "in kind service"), or 3) the District's fiber can go in the City conduit down the middle of Aurora Avenue.		
ADVANTAGES		DISADVANTAGES
<ul style="list-style-type: none"> • Coordination between agencies on the Aurora Project could have City wide benefits for future planning 		<ul style="list-style-type: none"> • Increases logistical and contractual requirements
•		•
•		•
•		•
•		•
RECOMMENDATION/RESULT		
Continue to coordinate with School District to evaluate Aurora Project. Design team to look at utilizing Global Crossing/City conduit in Aurora. City management to review Shoreline School district infrastructure City-wide and discuss potential for franchise or cost sharing options.		

2008058

DESIGN SUGGESTION

This page intentionally left blank.

FUNCTION: Miscellaneous		IDEA # 66
TITLE: Incorporate City commitments to property owners into contract documents		
BASELINE DESIGN ASSUMPTION		
The City is acquiring property and other rights for the project: temporary construction easements (cumulative 120 days for life of construction) and a property rights permit (restoration, undergrounding utilities to buildings, and driveway reconstruction). City is planning to include ROW plan and permits in construction documents.		
PROPOSED ALTERNATIVE		
In addition to including ROW plans and permits in the construction documents, hold a separate meeting with the contractor at the beginning of construction to discuss tracking of temporary construction easement uses and any special property owner commitments. Specify this requirement in the CM scope of work.		
DISCUSSION		
The City and contractor must be coordinated to respect private property temporary construction easements and private property owner impacts. The City and contractor need to have daily records that together can be used to track cumulative days within temporary construction easements.		
ADVANTAGES		DISADVANTAGES
<ul style="list-style-type: none"> • Lessens impact on businesses 		<ul style="list-style-type: none"> • Violation of TCEs could result in additional compensation to property owners (potentially lawsuit)
<ul style="list-style-type: none"> • Tracks commitments to property owners to ensure appropriate restoration 		<ul style="list-style-type: none"> •
<ul style="list-style-type: none"> • 		<ul style="list-style-type: none"> •
<ul style="list-style-type: none"> • 		<ul style="list-style-type: none"> •
<ul style="list-style-type: none"> • 		<ul style="list-style-type: none"> •
RECOMMENDATION/RESULT		
Write specification for contractor inclusion of private property TCE use into daily reports.

3.1 Baseline Materials

Baseline materials provided at study

- Aurora Corridor Improvement Project (N 165th to N 185th) 30% project submittal (by HDR)
- Aurora Ave North Multimodal Corridor Project N 145th to N 165th Bid Tabulations (by CoS)
- Aurora Ave North Multimodal Corridor Project N 145th to N 165th Geotechnical Report (by CoS)
- Proposed agreements with franchise utilities on coordination and relocation (by CoS)
- Cost estimate for 30% project submittal (by HDR)
- Aurora Ave. North Multimodal Corridor Project N 145th to N 165th (by CoS)

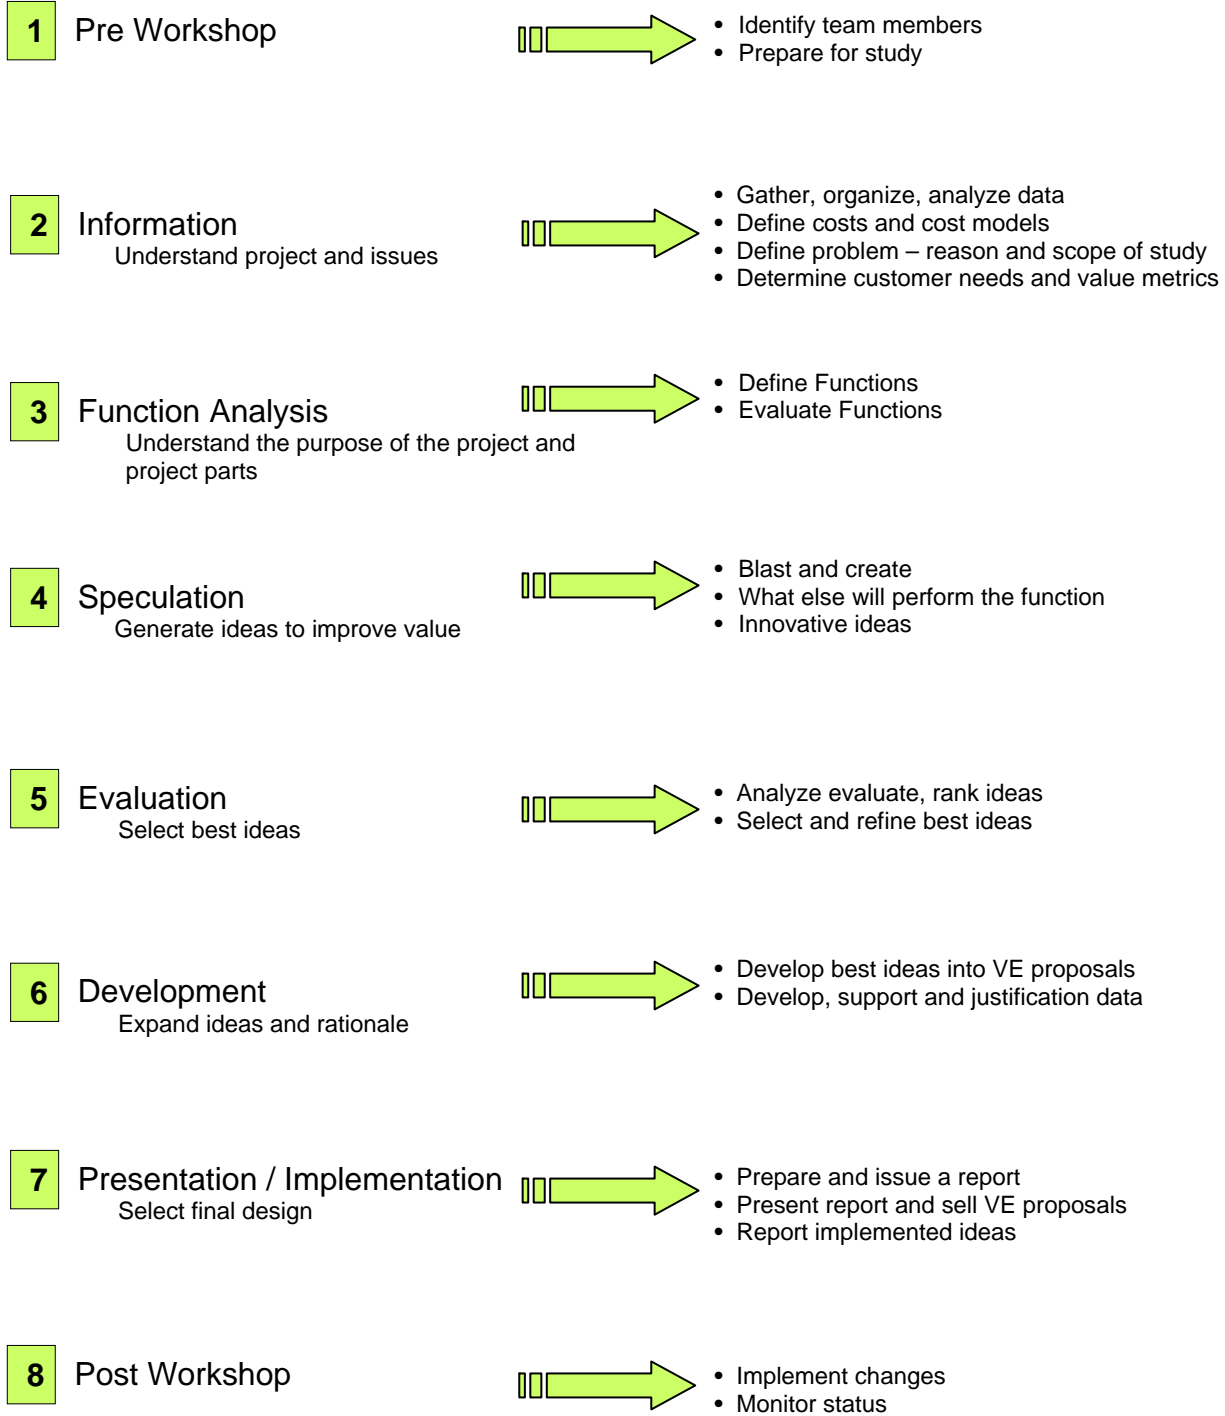

3.2 Constraints

Project Constraints

- Median widths at 16' to keep U-turns available for business access management
- WA DOT channelization plan
- Right-of-way section is fixed
- Roadway section is fixed
- Pole designs carry over from phase 1
- Seattle City Light property adjacent to Aurora Ave from 178th to 188th

3.5 Function Analysis

Function	Function Type
Improve Safety	Basic
Accommodate Access (business)	Required Secondary
Support Vision (community)	Secondary
Improve Efficiency (construction)	Secondary
Accommodate Jurisdictions	Secondary
Accommodate Runoff	Required Secondary
Improve Water Quality	Secondary
Define Core	Secondary
Support Education	Secondary
Encourage Development	Secondary
Accommodate Pedestrians	Required Secondary
Accommodate Transit	Required Secondary
Improve Access	Secondary
Encourage Growth	Secondary
Increase Level of Service	Required Secondary
Improve Image	Secondary

3.6 Observations

- WA DOT constraining the project geometrically
- Traffic staging opportunities exist with existing connecting side streets
- Two city-controlled conduits are in the fiber optic trunk
- Lots of auto and pedestrian traffic – safety consideration
- Safety and operational issues for contractors
- The fewer relocation or realignment options for pedestrian paths are preferred
- Good access to the Interurban Trail
- Businesses are drive-in
- Bus access looks to drive a high percentage of pedestrians
- SCL property may be option for construction staging
- SCL does not allow ponded water within their right-of-way
- SCL open space south of 185th and adjacent to Ronald Pl. would be a good place for water quality treatment
- Mixture of funding sources
- Jurisdictional disagreement regarding driveway widths
- Right-of-way acquisition could impact the schedule
- City is a 'CA' agency

3.7 Lessons Learned

- Coordinate locations for surface improvements at bus shelters
- Getting additional work or commitments from Seattle Public Utilities is difficult
- Interfaces at back of sidewalk and properties were not well planned in phase 1
- Make property rights clearer
- Review landscape plans to improve
- Traffic control strategies and penalties can be improved
- Clarify responsibilities between the City, contractor, and utilities
- Continue business briefings between City, contractor, and businesses
- Review project shutdown opportunities during holidays
- Lighting/temporary illumination should be improved (seasonal)
- Coordination between public and private development should be reviewed
- Coordinate final paving with completion of all underground work
- Tracking of utilities remaining on poles needs to be continuous
